FOREWORD

The Working Group on Baltic Salmon was established in 1958 as a standing Committee on Baltic salmon problems. At its first sitting it decided to compile available data as a basis for further studies because even if the object of the Working Group was that of a contact group for mutual information and stimulation as to studies of Baltic salmon, the desirability of some kind of report to be presented to the Salmon and Trout Committee of that time was immediately evident.

In 1962 at the sixth sitting of the Group a programme recommendation was made and the following year a draft of a "Progress Report, No.1" was presented and discussed. The outline of this report largely corresponded to the present Reference Report. As several items needed a more thorough treatment and especially as the prerequisites necessary for the construction of a population model were not fulfilled, it was decided to look further into these questions, before a new draft was prepared. The completion of the work was however delayed, mainly because material for certain items of the Report proved not to be readily accessible.

The presentation of this Report is primarily due to Dr B Carlin, the Chairman of the Working Group for 10 years and the promoter of the activities of the Group in general. He took the initiative, prepared the outline and made the greatest efforts to complete the Report before he died in 1971.

Contributors to the Report are listed below:

Denmark:	O Christensen
Federal Republic of Germany:	R Kändler F Thurow
Finland:	E Halme J Toivonen
Poland:	F Chrzan S Zarnecki R Sych
Sweden:	B Carlin A Lindroth N Johansson P-O Larsson
U.S.S.R.:	N M Lishev A Mitans.

ACKNOWLEDGEMENT

This Report was initiated in 1962 and has received help and encouragement from many sources. The editors wish to express sincere thanks for the splendid cooperation of all contributors and cooperators. We are especially grateful to K A Pyefinch, who has kindly read the entire manuscript in order to correct the English language and who has given us very helpful advice during the editing of the Report.

-O-O-O-

EDITORIAL NOTES

As indicated by the title the object of the Reference Report is to supply basic information on Baltic salmon and to a certain extent on Baltic sea trout as well.

Greater weight is attached to salmon than to sea trout because salmon, as a wider migrating species, is subjected to extensive exploitation far from home waters and consequently needs international cooperation in research and management to a far greater extent.

On the other hand, a variety of problems are shared by both species and also find common solutions; for that reason a partial inclusion of sea trout was thought to be reasonable. The existence in the Baltic of stocks of wide-migrating sea trout besides populations with more limited migration routes further supports this point of view. The wide-migrating sea trout - showing great resemblance to salmon not only regarding migration pattern, but also as to growth - originate in the river Vistula and in the West Pomeranian rivers. Besides giving rise to an important local fishery they are an important component of the offshore salmon catches of several nations, as it is evident from the catch statistics in Section 4. These are the reasons why special attention is devoted to sea trout in the Polish contributions to the present Report.

Baltic salmon are considered to be the stock of salmon living in the Baltic Sea and in the connected gulfs and affluents, separated from the "true" Atlantic salmon by the Danish Belt Seas. Swedish tagging experiments have clearly demonstrated the small amount of overlapping of these two populations. Out of 114 000 recaptures resulting from smolt taggings in 1951-70 in Swedish rivers running into the Baltic, only 0.4% were reported from outside the Baltic area. The main part of these extra-Baltic migrants, or 0.3% of the total recaptures, was taken between the Danish Islands. Correspondingly the proportion of recaptures in the Baltic from tagging experiments with Atlantic salmon on the Swedish west coast in 1966-70 amounted to 0.8%. (Personal comm. from the Salmon Research Institute, Sweden).

## SECTION 1: INTRODUCTION

1.1

### Review of Baltic Salmon Management Problems

Until the 20th century the study of Baltic salmon was the object of a few scientists, amateurs and fishery administrators. During 1860-70 interest in artificial fertilisation of salmonids - a technique at that time re-discovered in France - arose and hatcheries were established in some rivers in an attempt to supplement the natural production. The decline of the stocks of Baltic salmon about the end of the century and the establishment of the International Council for the Exploration of the Sea however gave the decisive impetus to salmon research.

In 1903, the year after the inaugural meeting of the International Council, a Subcommittee within Committee C for the Baltic area was formed under the leadership of Dr F Trybom (Sweden) to consider the salmon and sea trout problems of great concern to the nations bordering the Baltic and a number of reports were presented in the following years. Estimates were made of the level of the salmon fishery in the Baltic, information was provided on hatcheries and liberation of salmon and sea trout in Baltic rivers and on the national measures taken to protect the salmon stocks. Because of the decreasing yield of the salmon fishery suggestions were made for international agreements on propagation and protection of the stocks.

In 1912 a special section of representatives from the Baltic countries was formed to consider the main problem, the reason for the decline of the stocks in the Baltic rivers and the possibilities of an improvement in the situation. For this purpose 5 rivers situated in Russia, Sweden, Denmark, Finland and Germany respectively were chosen as subjects for observations and investigations. A report by Dr H Henking (Rapp. p.-v. Réun. Cons.int.Explor.Mer, 16, 1913) described the salmon fishery in the Baltic and the research rivers, but the First World War interrupted cooperative work. However, in his second report (Rapp.p.-v.Réun. Cons.int.Explor.Mer, 23, 1916), Dr Henking announced progress in research as some of the countries had reported on catch statistics, tagging of adult salmon and natural and hatchery-reared smolts, scale analyses and other special studies.

After the war, the Baltic salmon and sea trout were dealt with in the Limnological Committee of ICES which promoted the publications of two papers by Dr Henking: *Untersuchungen an Salmoniden I and II* (Rapp.p.-v. Réun. Cons.int.Explor.Mer, Vol.61 (1929) and Vol.73 (1931)), which dealt with racial studies of salmon and sea trout.

At the meeting of ICES in May 1927, it was resolved that, before the next Annual Meeting, a meeting of the Transition Area Committee and the Baltic Area Committee should take place in order to discuss the scientific basis for practical measures to be taken regarding i.e. the salmon. At this meeting several special papers concerning the proposals for protection of the salmon and sea trout in the Baltic were presented and it was agreed to recommend an international size limit for salmon and sea trout in the Baltic (Rapp.p.-v.Réun. Cons.int.Explor.Mer, Vol.48 (1928)).

At the ICES meeting in 1931 the name of the Limnological Committee was changed to the "Salmon and Trout Committee". The following year a meeting of experts, to consider the methods of investigations employed

for salmon and trout was recommended and, in 1933, a Sub-Committee was appointed to draft the programme for this meeting. This took place in the same year and made the following recommendations (Rapp.p.-v.Réun. Cons.int.Explor.Mer, Vol.91 (1934)):

1. That the questions concerning the protection and improvement of salmon in the Baltic should be treated in the Baltic Committee.
2. That the scales for age determination of salmon and sea trout can be taken from different parts of the body of the fish but, for determination of the calculated rate of growth, scales taken immediately above the lateral line and below the dorsal fin were recommended.
3. That the general method of measuring of the length of salmonoid fish should be from the tip of the snout to the end of the central ray of the caudal fin.
4. That in every scientific publication involving statistics the method of dealing with statistical matters should be clearly indicated.
5. That in expressing the results of scale reading, the years in the river and the years in the sea should be expressed with a decimal point between the figures; the spawning mark should be expressed by the letter "G"; part of a year should be expressed by a cross "+", and a whole year by the number "1".
6. That in publishing the results of scale reading the amount of erosion should be expressed according to a scheme used in Scottish investigations and expressed by the Latin letter "E" and a number.
7. That photographs of typical sea trout and salmon scales should be collected with a view to the publication of a short treatise by the International Council to serve as a guide to workers on the subject.
8. That for expressing the value of the coefficient of condition "K", separate formulae should be used for Salmon and Sea Trout:  
The formula for salmon should be:  $K = 100 W/L^3$   
The formula for sea trout should be:  $K = 84.3 W/L^3$   
The weight (W) should be expressed in grammes; the length (L) in centimetres.
9. That it is advisable to issue from time to time additional editions of the "Guide to Fishmarks" in order to include the most recent types of marks.
10. That the question of the practical and economic value of artificial propagation of salmon and sea trout in place of natural methods is of great importance; accordingly, experiments on a comprehensive scale should be conducted, the results of which would be applicable and accepted generally.

Subsequent to the establishment of the Salmon and Trout Committee more detailed information on the work on Baltic salmon carried out by the

different countries were published in the annual "Administrative Reports" of ICES. In the following years many papers on Baltic salmon problems were published by ICES in the "Rapports et Procès-Verbaux des Réunions"; the papers mentioned below are of general interest:

- G Alm              Salmon in the Baltic precincts (Vol. 92, 1934)  
T H Järvi and W J M Menzies      The interpretation of zones on scales of salmon, sea trout and brown trout (Vol. 97, 1936)  
T H Järvi              Fluctuations in the Baltic stock of salmon (Vol. 106, 1938)  
T H Järvi              On the periodicity of salmon reproduction in the northern Baltic area and its causes (Vol. 119, 1948).

(The reader is further referred to the comprehensive list of publications in Section 6 of this Report).

The Second World War imposed a break in the salmon work. When the activities of the Salmon and Trout Committee were resumed at the meeting of ICES in 1945, the interest in Baltic salmon increased because of:

- 1) The immense peak in the Baltic salmon stock and in the coast and river catches, which unexpectedly occurred in the mid-forties.
- 2) The menace to the natural propagation of Baltic salmon by the hydro-power projects developed in Finnish and Swedish salmon rivers.

As far as Sweden was concerned this led to the constitution of a "Migratory Fish Committee" (later "The Salmon Research Institute"). At the ICES meeting in 1946 a cooperation between this body and the Salmon and Trout Committee was proposed (Rapp.p.-v.Réun.Cons.int.Explor.Mer, Vol. 117, 1947).

The growing interest in salmon in general and especially in the Baltic stock, as manifested by the increasing activities of the Salmon and Trout Committee, resulted in a resolution at the ICES meeting in 1957 that a Symposium should be arranged in connection with the next meeting of ICES and that the subject matters to be discussed should be:

- (i) the effectiveness of liberating fry, parr or smolts of salmon and sea trout under different conditions, and
- (ii) tags for salmon and trout and their relative effectiveness.

At this Symposium twenty papers were read on tagging methods, smoltification, liberation, population dynamics and salmon conservation. A number of recommendations were proposed, including one that a working group to consider Baltic salmon problems should be established. This was approved by the Salmon and Trout Committee and the Council (Rapp.p.-v. Réun.Cons.int. Explor.Mer, Vols. 146 and 148, 1959). Further details about the establishment and the activities of the Working Group on Baltic Salmon are given on page 9.

At the ICES meeting in 1953 Dr G Alm, Sweden, communicated a paper to the Baltic Sub-Committee on the subject of the necessity to impose restrictions on capture of salmon in that region. The suggestions, comprising closed season, minimum size for salmon and minimum mesh and hook size were approved by the Sub-Committee and adopted by the Consultative Committee. In accordance with a resolution of the Council the proposals were submitted to the Governments of Denmark, Federal Republic of Germany, Finland and Sweden.

After negotiations in 1953, 1954 and 1957 between the Governments mentioned above, an international agreement was drafted in 1962. The agreement "The Baltic Salmon Fisheries Convention of 1962" was ratified by Denmark, Federal Republic of Germany and Sweden in 1963 and came into force in 1966. The Articles of the Convention are set out in an Appendix to the present Report. As no official version in English of the Convention exists, the most important Articles should be briefly emphasized:

- Article 1      The Convention Area includes the Baltic Sea, the Gulf of Bothnia and Gulf of Finland, limited by a line from Falsterbo (the southwestern point of Sweden) to southern Zealand, the southern Danish islands and Sønderborg (Jutland).
- Article 5      Minimum mesh size of salmon drift nets of natural and synthetic fibres: 170 and 160 mm respectively.  
                  Minimum gap (shortest distance between point and shaft) of salmon hooks: 19 mm.
- Article 6      Minimum length of salmon: 60 cm.
- Article 10     The establishment of a Permanent Commission in which each Contracting Party is represented. The duty of this Commission is to establish contacts with scientists and research institutes in order to promote conservation and rational exploitation of the stock of Baltic salmon and to consider the expediency of changes in and additions to the Convention.

At the request of this Commission several investigations and experiments with drift nets and long lines were carried out. Papers on the results were submitted to the Commission at meetings in 1968, 1969 and 1970.

In 1969 the Permanent Commission agreed on a recommendation about closed seasons and the prohibition of pelagic trawling for salmon fishing. The Contracting Parties adopted these additions to the Convention, but on account of formal problems they were not ratified when the editing of this Report was completed.

In 1971 Poland also joined the Convention. Already in 1964 Finland enacted regulatory rules similar to the Articles of the Convention.

As the exploitation of Baltic salmon by U.S.S.R. exclusively takes place in rivers, river mouths and surrounding coastal areas, no special legislation is elaborated by this nation for the offshore salmon fishery in the Baltic apart from a general minimum size of 60 cm for salmon.

Salmon problems were considered at "The Baltic Sea Conference 1972" in Stockholm arranged by "The Swedish Federation of Fisheries' Associations" attended by Delegates from all the countries bordering the Baltic. In a resolution from the Conference it was stressed that strict protective measures were urgently required if the natural resource represented by salmon was not to be lost. Each state should therefore restore or by stocking compensate for their former smolt production, establish new spawning areas by construction of fish ways, investigate the effect of different fishing methods, follow the fishery statistically and not allow too intensive fishing. As the most urgent step however the Conference agreed that all states should ratify the Baltic Salmon Fisheries Convention, and in addition proposed closed seasons and provisions regarding details of gear mounting and maximum amount of gear per fishing vessel.

1.2 Formation and Activities of the Working Group on Baltic Salmon

At the Symposium on Salmon and Sea Trout held at Charlottenlund in 1958 in connection with the Annual Meeting of ICES, proposals were made about the establishment of a standing committee on Baltic salmon problems in order to promote cooperation in research and management of the salmon stock confined to the Baltic area.

The proposal was adopted as one of the recommendations of the Symposium and approved by the Salmon and Trout Committee and the Council, and it reads as follows:

- (f) that the Salmon and Trout Committee should establish a Working Group to consider the problems of salmon and sea trout in the Baltic;
- (g) that the Working Party on Salmon in the Baltic meet, if possible, in Sweden in March 1959 to further their consultations.

The following members of the Committee were nominated:

Denmark:	Mag. K Larsen, Mag. J Knudsen
Finland:	Prof. E Halme
Federal Republic of Germany:	Prof. R Kändler, Dr. F Thurow
Poland:	Prof. St Zarnecki, Prof. F Chrzan
Sweden:	Dr. B Carlin (Chairman), Dr. A Lindroth
U.S.S.R.:	Prof. N J Koshin, Dr. N M Lishev.

In 1964, the member list was revised as appears from the recommendation from the Salmon and Trout Committee quoted in the section on the activities of the Working Group.

According to a further revision in 1972 the members of the Group are the following persons:

Denmark:	Mag. O Christensen
Finland:	Fil.lic. J Toivonen
Federal Republic of Germany:	Prof. F Thurow (Chairman), Prof. H Mann
Poland:	Prof. F Chrzan, Dr. Chelkowski, Dr. R Sych
Sweden:	Fil.lic. N Johansson
U.S.S.R.:	Dr. B Evtjukhova

The same year Mag. O Christensen was elected as Chairman and Fil.lic. N Johansson as Secretary.

The following survey of recommendations and excursions gives an idea of the activities of the Working Group.

A. Recommendations submitted to and adopted by the Salmon and Trout Committee, quoted from Procès-Verbal de la Réunion, i.e. according to the wording given by the Committee and the Council when approved

1959

1. The Salmon and Trout Committee recommends that the work of the Baltic Group should be continued in order to discuss sampling methods and treatment of data and to exchange information on the progress of investigations. The next meeting of the Baltic Working Group will be held in Copenhagen on 15-20 March 1960 (C.Res.1959/17:g:3).
2. The following recommendations submitted by the Baltic Working Group were adopted by the Committee (C.Res.1959/17:g:4):
  - (a) A survey of Baltic salmon rivers ought to be made to contain data on original and recent production capacity of natural smolts of salmon and sea trout, and recent and planned production of smolts by means of liberations of reared parr or smolts.
  - (b) Tagging operations are highly desirable, especially of:
    - (i) smolts, both natural (wherever possible) and reared in Sweden and especially in Finland, U.S.S.R., and Poland,
    - (ii) kelts whenever such are liberated after stripping,
    - (iii) clean fish in the sea, especially by such countries as the Federal Republic of Germany and Denmark, which, for obvious reasons, cannot take part in the tagging of smolts.
  - (c) Studies on the river life and post-smolt period are important, especially:
    - (i) size and growth rate of parr and their variability,
    - (ii) size and age of smolts, their variability and its causes (environmental conditions),
    - (iii) mortality and its causes,
    - (iv) food organisms and feeding conditions.
  - (d) Investigations into predation on post-smolt and adult stages of salmon and sea trout.
  - (e) Sampling data on size, age classes, growth, condition factors, sex ratio, fecundity, sexual stages and food, from unselected commercial catches, data on catch, effort and catch per unit effort.
  - (f) Wherever large catches or landings of salmon are made the opportunity should be used to determine the relation between catch of different sea age classes and recovering of tagged fish made within these lots in order to make smolt number estimates possible.

### 1960

It was recommended that the important investigations on commercial catches of Baltic salmon reported on by Danish and German representatives be continued, and, if possible, extended to permit estimations of abundance of year classes and other basic data for the study of population dynamics and biology of the Baltic salmon, necessary for the management of the stock on an international basis (C.Res.1960/10:h:3).

### 1961

After the Scale-Reading Symposium the Committee decided, upon recommendation of the Baltic Working Group, to consider a standardisation of

- (i) scale sampling for back-calculation purposes as to position of sample on the fish, and
- (ii) back-calculation methods for salmon and sea trout.

As the Group found it desirable to meet in Poland to study i.e., the salmon and sea trout in the river Vistula, the Committee was asked to make the necessary arrangements for that meeting (C.Res.1961/14:7:e).

### 1962

It was decided to support the following recommendations of the Baltic Working Group (C.Res.1962/10:7:d):

- (i) that the Working Group should continue, especially to study the population dynamics of the Baltic stocks of salmon and sea trout;
- (ii) that the next meeting of the Baltic Working Group should be held in 1963. Dr. Lishev promised to examine the possibilities of arranging the meeting in the U.S.S.R., together with an excursion to study salmon conservation in the field. The main subject of discussion at this meeting would be population dynamics. Dr. Lishev and Dr. Thurow promised to give a survey of their work on this subject.

### 1963

(C.Res.1963/9:b). - That the countries exploiting the salmon stocks in the Baltic should be requested to give annually the following information on their fisheries:

- (a) monthly catches, if possible divided into salmon and sea trout,
- (b) statistics on weight categories,
- (c) length and/or age composition data, and
- (d) catch per unit of effort data (e.g. catch per 100 nets and 1 000 hooks, if possible including seasonal and regional variations).

1964

Recommendations submitted by the Working Group to the Salmon and Trout Committee: 1. That the member list should be revised. 2. That the Working Group should continue its work and the next meeting be held in Finländ. 3. That an authoritative terminology of stages and types of salmon and sea trout is desirable - were adopted as quoted below:

1. That the Baltic Working Group should continue to function during the forthcoming year and that its members should consist of the following persons: K Larsen and O Christensen (Denmark); E Halme and J Toivonen (Finland); R Kandler and F Thurow (Federal Republic of Germany); F Chrzan and S Zarnecki (Poland); B Carlin and A Lindroth (Sweden) and N M Lishev and N I Koshin (U.S.S.R.), and that the next meeting be held in northern Finland in the autumn of 1965 (C.Res.1964/4:7).
2. That a Questionnaire drafted by the Chairman should be sent to all members asking them to revise as far as possible the list of names for various stages in the life of salmon and sea trout etc., including natural and reared fish as published in earlier Council papers and to return the completed Questionnaires to Mr I R H Allan of England, who had offered to act as Rapporteur for this purpose (C.Res.1964/11:8:c).

1965

1. That smolt taggings in the western Baltic, Riga Bay and the Bay of Finland and adult salmon taggings in the open Baltic should be carried out by member countries (C.Res.1965/4:19).
2. That experiments involving the transfer of salmon between rivers should be carried out by Baltic member countries to test out the feasibility of such transfers on a large scale (C.Res.1965/4:20).

1966

1. That in view of the interference in a variety of ways with rivers flowing into the Baltic and the adverse effects on salmon and sea trout stocks resulting therefrom, the member countries concerned should be asked to consider what steps should be taken to improve the position, including such matters as the control of pollution, facilitating the movement of ascending and descending fish and rearing of fish by artificial means (C.Res.1966/4:18).
2. That, as it seems likely that there will be a need for keeping under review the stocks of salmon in the Baltic for several years to come, the Baltic Salmon Working Group should continue, it being understood that the first definitive report will be available for the next meeting of the Committee (C.Res.1966/4:21).

B. Recommendations within the Working Group

1960 (March)

1. A bibliography on scale-reading is wanted. Dr Lindroth undertook the compiling of a list of papers pertaining to the study of body/scale relationship.

2. If possible the Group should send a member to the ICNAF meeting on scale-reading in Bergen in May this year and invite representatives from ICNAF to visit the Scale Symposium of ICES in Moscow in the autumn.
3. The Group is interested in an excursion to the Baltic salmon rivers in U.S.S.R. in connection with the ICES meeting in Moscow. Dr Bogdanov should convey this desire to the Chairman of the Salmon and Trout Committee, Prof. G V Nikolsky.
4. The Group should meet in Moscow in the autumn for a business sitting and again in Kiel next year for two to three days in the period 15 March to 15 April.

1960 (September)

1. That the next meeting was to be held in Copenhagen the day before the Symposium on Reading of Salmon Scales in connection with the 1961 meeting of the Council.
2. That the main subject for discussion should be salmon population dynamics in the Baltic.

1962 (July)

1. The member countries should during 1963 supply, to the Chairman or the Secretary:
  - Data for survey of salmon rivers,
  - Bibliography on Baltic salmon to the year 1962 inclusive,
  - List or diagram of organisations concerned with Baltic salmon,
  - List of agreements concerning terminology and methods.
2. Remaining programme recommendations made up to now should during 1963 be systematized and, as proposed now, the following new items are to be considered. Sea trout of the wide-migrating form is to be included in the work (Zarnecki).
  - Statistical data on sea catch should not refer to calendar year but to fishing season or both (Christensen).
  - Food of small salmon in the sea should be studied (Carlin).
  - Transplantations for experimental purposes should be studied (Zarnecki).

1962 (October)

- (a) Since the importance of sea trout is increasing in Denmark, Germany and Poland, this fish should be given increased attention by the Working Group.
- (b) The survey of Baltic salmon rivers should be widened to cover the trout streams (it was mentioned that the survey of Danish rivers now almost completed, will cover all rivers).
- (c) A joint German-Danish project of releasing tagged salmon smolts in the western part of the Baltic is now under way and the first smolts will be released in 1964.

1963 (June)

- (a) A progress report should be prepared along the lines discussed by this meeting. A sub-group (Carlin, Christensen, Thurow) shall discuss the Section devoted to the Baltic salmon population model.
- (b) Sea catch in the Baltic proper should if possible be recorded as catch per month or half year.
- (c) The next meeting is proposed to be held in Kiel in March 1964.

1966 (August)

Institutes which report on foreign tags should forward the tag to the country to which it belongs together with a map indicating the place of recapture.

1968 (October)

As "Sea life of Atlantic salmon" was accepted as main subject for the meeting in 1969 of the Anadromous and Catadromous Fish Committee, the Working Group decided to contribute with a relevant joint report on Baltic salmon. In order to compile and discuss the material necessary for the report it was proposed to arrange a meeting in Hamburg or Kiel, February 1969.

1971 (September)

The proposal that the Working Group should be continued at least until the Reference Report has been completed and the assessment of salmon in the Baltic is taken a further stage, was approved by the Committee.

C. Excursions in connection with the sittings of the Working Group

Sweden, March 1959

Excursions to the Hölle Salmon Laboratory of the Migratory Fish Committee (now Salmon Research Institute), to the Forsmo salmon rearing station of the State Power Board and Bergeforsen's salmon rearing station of the Bergeforsens's Hydroelectric Power Company.

Denmark, October 1959

Excursions 2-3 October to the trout ponds at Højenkær, at Vingsted and Spjarup, to the fish harbour and trout processing plant in Esbjerg, and to the "Danish Trout Pond Farmers Experimental Station" at Brøns.

Denmark, March 1960

Excursions to the fishing harbour of Rønne in Bornholm.

Poland, July 1962

Excursions to the Sea Fisheries Institute in Gdynia, to the rivers Raba and Dunajec in south Poland, Lopuszna rearing station, Roźnów and Czchów power stations and Mydlniki Fisheries Research Station.

U.S.S.R., June 1963

Excursions to Daugava and Gauja rivers, to Tome rearing station and Zvejniek collective fishery farm.

Federal Republic of Germany, March 1964

Excursions to sea trout brooks and hatcheries and to the "Hydrobiologische Anstalt" in Plön and to the "Bundesforschungsanstalt für Fischerei" in Hamburg-Altona.

Finland, August 1966

Excursions to river Oulujoki with Montta rearing station, Maalismaa at Iijoki, Ischaara power plant at Kemijoki, and Muonio rearing station at Torneojoki.

SECTION 2: ORGANISATIONS, PROJECTS AND BIOLOGISTS CONCERNED

WITH BALTIC SALMON

2.1      Denmark

breeding plants, protection of salmon and salmon  
rivers, fishery control and ichthyological obser-  
vations.

SECTION 3: SURVEY OF BALTIC SALMON RIVERS

3.1 Denmark

No Danish stream flowing into the Baltic supports a salmon run, nor  
does any information exist on runs in former times. In 1972  
stocking experiments with salmon were carried out from the Island of  
Bornholm situated in the Baltic main basin. A number of 2 000 salmon  
smolts were tagged and released in two small trout streams: Læså and  
Øleå.

Of the Danish water courses draining into the Baltic Sea, 168 are, by nature, fit for sea trout spawning. Early in the century about 110 were used regularly by sea trout. In 1960 the number was reduced to 80 as a consequence of human activities, 20 running into the Baltic main basin (from Bornholm) and the remaining into the Western Baltic.

3.2 Federal Republic of Germany

No German streams flowing into the Baltic Sea support salmon runs nor does any information exist on runs in former times. In the years 1966-73 stocking experiments were carried out in two small streams running into Kiel Bay and about 12 000 hatchery-reared salmon smolts were added. None of these have been reported as ascending adult fish.

About 50 streams of the Federal Republic of Germany drain into the Western Baltic. At present 15 support a sea trout run.

Since 1965 a considerable decrease in the catches of sea trout has been noticed, probably a consequence of declining smolt production.

3.3 Finland

In former times sea trout existed in 47 Finnish rivers running into the Baltic. The total run of sea trout smolts at that time is estimated to 500 000.

Sea trout have now disappeared from 15 rivers and the total smolt production has decreased to 100 000.

Ref. Hurme, S., 1966: Suomen Itämeren puoleiset lokija taimenjoet. Eräries 20 (11):13-17. English summary: Salmon and trout rivers on the Baltic side of Finland.

See also Table on smolt production in Baltic salmon rivers, p. 23, and chart on Baltic salmon rivers in Finland, p.24.

SECTION 4: CATCH STATISTICS

4.1 Denmark

Notes to the Tables

Weight: gutted.

Sea trout (of the wide-migrating stocks) included.

Proportion of the catches 1.2 - 5.6 % during  
1962-72, annual mean 2.8 %.

For the years 1885-1909 sea trout of local  
origin also included.

Gear: before 1946 mainly coastal fishery with fixed  
hooks and drift nets.

From 1946 to about 1955 mainly offshore fishery  
with long lines and drift nets.

Since 1955 exclusively offshore fishery with  
long lines and with increasing dominance of  
drift nets.

Fishing area: Baltic main basin.

Since the 1950s a small part of the fishery  
took place in the Gulf of Bothnia (0 - 5.4%  
during 1962-72, annual mean 1.8%).

Ref.: Fiskeriberetning for årene 1889-1971. Published  
by the Danish Ministry of Fisheries.

Monthly catches: personal communication by the  
Danish Ministry of Fisheries.

\*) Preliminary data without possibilities for correction. According to "Fiskeriberetning for året 1960" the total catch was in fact 1 062 tons.

Table 3. Danish catch per unit effort of salmon in the Baltic Sea (weighted seasonal mean).

Season	Number of Salmon caught	
	per 100 nets	per 1 000 hooks
1957/58	-	17.2
58/59	-	20.4
59/60	-	11.3
1960/61	-	14.6
61/62	5.4	16.2
62/63	5.7	11.9
63/64	7.4	13.7
64/65	8.9	20.2
65/66	9.2	27.2
66/67	6.9	20.9
67/68	7.3	19.1
68/69	7.8	17.8
69/70	9.0	15.6
1970/71	6.0	11.1
71/72	7.9	22.4

An increase in the effort of salmon drift nets occurred during the seasons 1963/64 - 1967/68 as a consequence of the replacement of hemp nets by nets of synthetic fibres and reduction of the length of the strops connecting the net with the floating rope from 40-60 cm to 10-15 cm.

In the season 1969/70 the hook size was changed. Hooks with a gap of 15 mm formerly used were replaced by hooks with a gap of 19 mm according to the Convention. No statistically significant change of the effort of this gear is demonstrated however.

4.2 Federal Republic of Germany

Notes to the Tables

Weight: gutted.

Sea trout included. Proportion of the catches  
4-16 % during 1957-68, annual mean 7 %.

Gear: since about 1870 fixed hooks up to 20 naut.  
miles offshore in autumn and winter, set net  
and beach seines in summer and autumn inshore,  
around 1900, at latest, drift nets in spring  
inshore.

Between 1900 and 1948 mainly fixed hooks and  
drift nets.

Since 1948 offshore fishery by long lines and  
drift nets with increasing dominance of drift  
nets.

Fishing area: Baltic main basin, between Arkona Basin  
and Gotland basin (both included).

Between 1957 and 1968, 0.3 % of the total catches  
have been taken in the Bothnian Sea.

Since 1948 landings of the Federal Republic of  
Germany only; the figures for the German Demo-  
cratic Republic not available, but known to be  
insignificant.

68/69*)	7.6	13.3

\*) preliminary.

About 1962/63 through 1965/66 hemp were replaced by nets of synthetic material, and the length of the strops connecting the net with the floater line was reduced from 40-60 cm to 10-15 cm. (See notes to Danish data, p.35).

4.3 Finland

Notes to the Tables

Weight: ungutted

Sea trout included, 8-10% of the catches.

Gulf of Bothnia: mainly offshore fishery with long lines and drift nets in the Bothnian Sea and coastal fishery with bagnets in the Bothnian Bay.

Gulf of Finland: mainly offshore fishery with long lines.

During World War II no fishing took place in the eastern part of the Gulf.

Isle of Åland: offshore fishery chiefly in the Baltic main basin and in the Gulf of Bothnia with drift nets and to a less extent with long lines, but a small part of the fishery is carried out in the Gulf of Finland. Salmon fishing has been carried out in earlier times from the Isle of Åland, but catches were insignificant until 1946.

Rivers: for the years 1877-1919 the catch statistics of the Gulf of Finland rivers included the catches of lake Ladoga. For the years 1945-52 the catch statistics of the Gulf of Bothnia rivers included the catches of river Tana (running to the Arctic Ocean). River catches of salmon were 10-20 tons in the 50s and are now about 2-3 tons annually.

4.4 Poland

Notes to the Tables

Weight: gutted and ungutted.

Salmon sea fishing: coastal and offshore.

Gear: drift nets, hooks and long lines.

Fishing area: Gulf of Gdańsk and Baltic main basin.

Salmon river fishing: for the present less than 1 ton annually.

Sea trout sea fishing: coastal

Gear: gill nets.

Fishing area: mainly Gulf of Gdańsk.

Sea trout river fishing: including catches in lakes and Firth of Vistula and Firth of Szczecin, comprising however only a small proportion of the total river catches. The main part of the catches in river Vistula.

Gear: gill nets, fyke nets and electrofishing in the upper parts of the river systems.

4.5 Sweden

Notes to the Tables

Weight: gutted.

Sea trout not included.

Gear: mainly offshore fishery with long lines and drift nets with increasing dominance of drift nets. Before 1945 anchored lines with one hook only, and drift nets were used.

To a less extent coastal fishery with big traps. This fishery is carried out only at the east coast and especially in the Gulf of Bothnia.

In rivers mainly fixed engines and draft seine fishing.

Fishing areas: Baltic Sea main basin, Gulf of Bothnia and rivers.

4.6 U.S.S.R.

Notes to the Table

Weight: ungutted.

Sea trout: included, about 10% of the catches.

As a rule only maturing salmon enter the catches.

Salmon captured for artificial reproduction are included.

The catches are made exclusively in rivers, river mouths and in Gulf areas by means of stake nets, fyke nets and stake traps.

Fishing period: June - September.

## SECTION 5: STOCK ASSESSMENTS

### 5.1 Population Models Based on Swedish Tagging Experiments

5.1.1 Model based on tagging experiments in 1950-55 (Carlin, 1959).

Three factors affect the number of salmon of a certain year class in the Baltic Sea, fishing mortality, spawning migration and natural mortality.

Losses to the population caused by fishing can be estimated fairly correctly from recaptures of tagged fish even if they are a little too low as a consequence of tagging mortality and lost and unreported tags.

Escapement from the feeding grounds by spawning migration can be estimated from data on river and coastal catches and from the ratios of catch and escapement in rivers of ascending, tagged fish.

Losses to the population caused by natural mortality are unknown, but may be considered as the remaining mortality, if the two other factors can be estimated. The problem, however, is to distribute appropriate proportions of these natural losses among single age groups.

An estimate can be made on the following three assumptions:

- (a) that few of the original population remain as maiden fish in the Baltic after three years,
- (b) that the difference between natural mortality in the second and third year is small, and
- (c) that the natural mortality in the first year is 90 % (an initial mortality of, for instance 80 % implies that the losses afterwards from natural mortality are twice or three times those caused by fishing).

On the suppositions above a model of the population dynamics of Baltic salmon has been constructed (Figure 7, p.55). According to this very slight fluctuations in the initial mortality may cause considerable fluctuations in the surviving salmon stock. From a practical point of view this means that an improvement in the condition of the smolts released from the hatcheries may have a very favourable influence on the yield.

Ref.: Carlin, B.: Results of salmon smolt tagging in the Baltic area. Rapp.p.-v.Réun.Cons.int.Explor.Mer, 147:89-96; and: Vandringfiskutredningen Meddelande 7/1959.

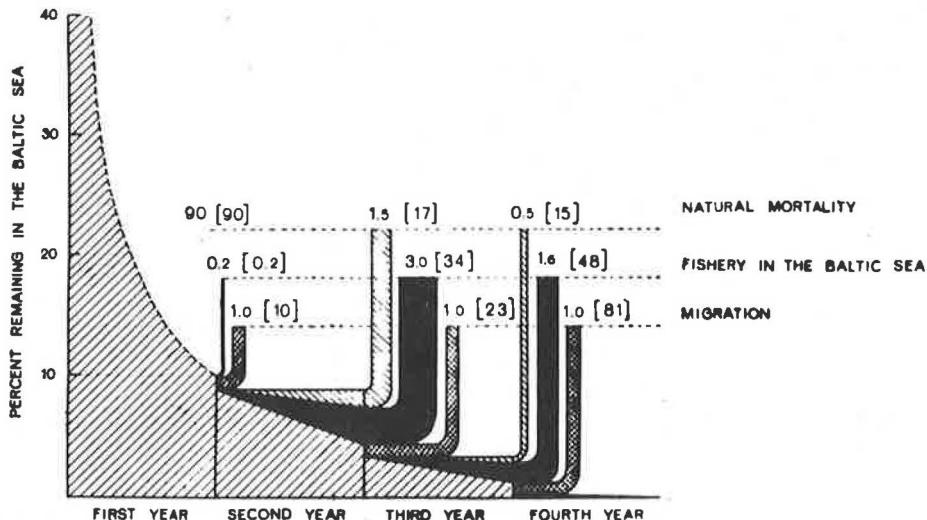

Figure 7. Percentage losses by migration, fishing and natural mortality of a year class of salmon in the Baltic. (Figures in brackets: percentage losses of the stock remaining at the beginning of the year).

- 5.1.2 Model based on tagging experiments in 1957 (Carlin, 1962), involving 82 723 released smolts resulting in 9 242 recaptures after the post-smolt stage.

The model has been constructed according to the principle of 5.1.1, the recapture data, however, were not used directly as estimates of the losses to the exploited stock in the sea.

The values of recaptures in the Baltic - representing losses to the population caused by fishing - have been increased by 10 %, to allow for lost and unreported tags.

The values of recaptures in rivers and river mouths - representing escapement from the feeding grounds by spawning migration - have been increased by 100 % during second summer and 30 % during the subsequent summers, to allow for the exploitation rate in the rivers and recaptures in the Gulf of Bothnia.

Losses to the population caused by natural mortality may still be considered as the remaining mortality, so that the sum of losses from the stock equals the original number recruited to the Baltic. In the model natural losses of 10 %, 20 % and 30 % are successively applied to the exploited stock in the 2nd, 3rd and 4th year in the sea. On these assumptions the mortalities during the 1st year in the sea are estimated to 85.5 %, 83.4 % and 80.0 % respectively.

Table 19 (p. 57) shows the population dynamics of the tagging experiment in 1957, when natural mortality in the sea-age groups 2, 3 and 4 is assumed to be 10 %.

On basis of the model, assessments have been made on the effect of changes in effort and age at first capture. As shown by Table 20 (p. 58) the starting point is 100 salmon at the beginning of the 2nd year in the sea and supposed natural mortalities of 10 %, 20 % and 30 %. With a decrease in fishing effort of 10 % and 20 % during the 2nd year in the sea and 10 % during the subsequent years, size and distribution of total catches in rivers and in the sea are estimated by number, weight and value of salmon.

As demonstrated by Table 20 this kind of regulation is the more effective the lower the natural mortality. Obviously a decrease in the sea fishing effort will increase the escapement to the rivers and consequently the river catches. In terms of value the coastal and river fishery earn an additional income of 40 % - 27 % corresponding with natural mortalities of 10 % - 30 %, whereas the sea fishery on the same conditions is subjected to a change of +3 % to -2 %.

Ref.: Carlin, B.: Synspunkter på frågan om Östersjöns laxbestånd i belysning av de svenska märkningsförsöken. Laxforskningsinstitutet, (5), 1962.

5.1.3 Model based on tagging experiments in 1958-1967 (P.-O. Larsson, the Swedish Salmon Research Institute, personal comm.), involving 723 380 released smolts resulting in 89 161 recaptures after the post-smolt stage.

Using the results of tagging experiments carried out during 1958-67, the population model constructed by Carlin (1962) can be revised. The extensive material forms a more reliable basis for the assessments than the 1957 experiment, but does not change the estimates significantly.

The same course of procedure as in 5.1.2 is pursued. The only difference in relation to the original Carlin model is that the number of salmon after 3 years in the sea is not considered to be zero, but according to the experiments in question are estimated to be 0.08 % of the original population.

Table 21 (p.59) shows the resulting parameters, and may be compared with Table 19. Figure 8 (p. 60) demonstrates graphically the recapture figures and the population model constructed on this basis.

Percentage of Number Tagged					Percentage of the Number of Survivors at the Beginning of each Year		
at the beginning of the year	migrating back to the river	remaining in the Baltic Sea	caught in the Baltic Sea	natural mortality	migrating back to the river	caught in the Baltic Sea	natural mortality

Year 5	0.08	0.05	0.03	0.01				

Table 21. Estimated mortalities of salmon in the Baltic based on tagging experiments in 1958-1967  
and on the assumption of a natural mortality of 10 % in the age groups 2, 3 and 4.

Figure 8. Model of survival, migration and catch of the salmon from tagging experiments 1958-67, on the assumption of 10% natural mortality in the 2nd, 3rd and 4th year in the sea. -

Shaded bars represent actual recapture records.

5.2

Mortality Parameters estimated on Basis of Catch and Effort Data and Recapture Records from Swedish Tagging Experiments (O. Christensen and F. Thurow, 1964)

This population study deals exclusively with Baltic salmon in their second and third year in the sea, roughly speaking the exploited marine phase. The material used in the assessments is partly catch and effort data from the fishing seasons 1957/58 to 1963/64, compiled by the nations exploiting salmon in the Baltic Sea, and partly from the Swedish tagging experiments 1953 to 1961.

Total mortalities are estimated as ratios of abundances of age groups. As indices of abundance, catch per unit effort data, age composition data and recapture rates are applied alternatively.

As the amount of fishing changed significantly during the period dealt with, total mortality can be divided into fishing mortality and natural mortality + spawning migration by correlating the coefficients of total mortality with corresponding fishing efforts.

From the equations

$$Z_1 = F_1 + (M_1 + T_1)$$

$$Z_2 = F_2 + (M_2 + T_2)$$

- relating the coefficients of total mortality ( $Z$ ) to the coefficients of fishing mortality ( $F$ ), natural mortality ( $M$ ) and spawning migration ( $T$ ) of the two age groups in question - it appears that the sum of natural mortality and spawning migration can be split into the two components, when  $Z_1$ ,  $Z_2$ ,  $F_1$  and the ratio of  $T_1$  and  $T_2$  are known and on the assumption that both  $F_1 = F_2$  and  $M_1 = M_2$ .

$Z_1$ ,  $Z_2$  and  $F_1$  are estimated as earlier mentioned.

The ratio of  $T_1$  and  $T_2$  is estimated from the relation between recaptures of A.2 and A.3+ spawners.

That  $F_1 = F_2$  is based on the assumption that selection by long line hooks - by far the most dominating gear at that time - is insignificant in this respect and that the relative proportion of the two age groups retained by drift nets was found to be rather uniform.

Based on the knowledge of predators in the Baltic,  $M$  is considered to remain virtually the same after the first year of sea life.

By the methods above the following estimates were obtained:

<u>A.1+ - A.2+</u>		<u>A.2+ - A.3+</u>	
F	0.73	F	0.73
M	0.10	M	0.10
$T_1$	0.50	$T_2$	1.40
$Z_1$	1.33	$Z_2$	2.23

5.3 Mortality Estimates and Stock Assessment based on Catch and Effort Data (F. Thurow, 1966)

Based on data from the German fishery in the years 1957-63 an attempt was made to assess the dynamics of the offshore salmon population in the Baltic.

Instantaneous rates of losses for the two most important sea age groups have been estimated by means of catch and effort data. In the first instance F was assumed to be the same for both ages and  $M = 0.1$  (after Christensen, 1964). Application of the values found did not result in the actual proportions of the yields of each age. The conclusion of this treatment was that fishing is selective, F being higher for age .2+ than for .1+. However, two equations were established, the proportion of the numbers caught in the second and in the third year in the sea and the proportion of the spawners after the second and third year, the values of these proportions being known empirically. Wide ranges of instantaneous losses were then successively applied to these equations. This method revealed that the parameters could take values only within certain limits (e.g. the instantaneous rate of losses due to spawning migration:  $0.3 < T_2 < 0.6$ ). Thus, the averages found were

$$\begin{array}{lll} A.1+ : M = 0.1 & F = 0.63 & T = 0.45 \\ A.2+ : M = 0.1 & F = 1.61 & T = 1.48 \end{array}$$

Calculations using these data indicated that there were 1.1 million salmon in the exploited phase and that the annual recruitment to the fishery in the Baltic Sea was 850 000 salmon.

6.3 FINLAND - until the year 1971

The Finnish bibliography relates to Baltic salmon, sea trout and landlocked salmon inhabiting some Finnish lakes. - Only generally known abbreviations for the names of the serial publications have been used.

Aalberg, A. F.

- 1948 Kymin kalastusoloista ennen ja nyt. - (Fishing in the Kymi before and now). - Suomen Kalastuslehti, 55(2):25-28.

Alm, Gunnar

- 1961 Kan fiske- och vattenkraftinteressena förenas? (Can fishing and hydroelectric interests be combined?). - Fiskeritidsskrift för Finland, 4:7-14.
- 1961 Ovatko kalastuksen ja vesivoimatalouden edut sovitettavissa. (Can fishing and hydroelectric interests be combined). Suomen Kalastuslehti, 68:150-158.

Anonymous

- 1892 Wanhhakaupungin putouksen kalatie. (The fishway of Wanhhakaupunki Falls). - Suomen Kalastuslehti, 1(1):12.
- 1897 Anjalan koskeen ehdotettu kalatie. (Proposal of a fishway for the Anjala rapids). - Suomen Kalastuslehti, 6(10-11):179.
- 1897 Lapuan joen kalamäärä. (The fish population in the Lapua river). Suomen Kalastuslehti, 6(2):37.
- 1898 Iijoen lohikalastus. (Salmon fishing in the Iijoki). - Suomen Kalastuslehti, 7(7-8):130.
- 1899 Kalastustentarkastelijan Keisarilliseen Suomen Senaattiin jättämästä ehdotuksesta kalastuksen parantamiseksi Kokemäenjossa. (Proposal of the Inspector of Fisheries to the Czar's Finnish Senate for the improvement of the fishery of the Kokemäenjoki). Suomen Kalastuslehti, 8(2-3):26-30.
- 1899 Sananen kalastussuhteesta Raahen-Kalajoen rannikolta. (A note on the fishing conditions on the coast between Raahe and the Kalo-joki). - Suomen Kalastuslehti, 8(5):81-83.

Anonymous (ctd)

- 1919 Kemi- ja Iijokien valtionkalastusten vastainen vuokraaminen. (Future renting of the State Fisheries in the Kemi joki and the Iijoki). - Suomen Kalastuslehti, 26(9-10):129-134.
- 1926 Ohjesääntö kalanistutustoimintaa varten Kokemäenjoella. (Rule for fish stocking in the Kokemäenjoki). - Suomen Kalastuslehti, 33(3):40-42.
- 1942 Oulujärven lohi ja kuha laskeutuvat alas Oulujokeen. (The salmon and pike-perch of Oulujärvi descent into the Oulujoki). - Suomen Kalastuslehti, 49(10):127.
- 1951 Oulujoen Merikosken kalastus. (Fishing at the Merikoski rapids in the Oulujoki). - Suomen Kalastuslehti, 58(9):173-174.
- 1953 Montan kalanviljelylaitos. (The fish hatchery at Monta). - Suomen Kalastuslehti, 60:110-111.
- 1963 Iijoen kalakantojen hoidon suunnitelmat. (Plans for the management of the fish stock of the Iijoki). - Suomen Kalastuslehti, 70:188-191.

Anttila, Risto

- 1970 Kalataloudelliset perusselvitykset vuonna 1969. (Fishery investigations in 1969). - Vesiensuojelulaboratorion tiedonantoja 1970, 2:1-13.

Arasto, Viljo

- 1965 Lohisiiman käyttö merialueella. (Sea fishing with salmon long line). - Suomen Kalastuslehti, 72:154-158.
- 1965 Havsfiske med laxrev. (Sea fishing with salmon long line). Fiskeritidsskrift för Finland, 5:112-115.

Artimo, Atso

- 1954 Lausunto niistä haitoista ja vahingoista, joita Kymijoen Pernoonhaaran säännöstelystä koituu kalastölle ja kalastukselle. (Report on damage and disturbance of fish stocks and fishing caused by the Pernoonhaara reservoir in the Kymijoki). Moniste.

Bergman, Gösta

- 1971 Itämeren kalastuksesta. (Fishing in the Baltic Sea). - Luonnon Tutkija, 75(3-4):126-133.

Blomqvist, Edv.

- 1912 Huomattavimmista kalastuslaitteista Kymijoessa ja sen vesistöissä. (The main fishing facilities in the Kymijoki system). Suomen Kalatalous, 1:130-140.

Brofeldt, P.

- 1914 Lohikalojen ikä- ja kasvumääräyksiä. (Determination of age and growth rate in salmon). - Suomen Kalastuslehti, 21:141-142.
- 1930 Ylä-Vuoksen kalastuksista. (The Ylä-Vuokso fisheries). - Suomen Kalatalous, 11:111-119.

Brofeldt, P. (ctd)

- 1931 Toimenpiteitä kalannousun helpottamiseksi Kymijoessa. (Measures for facilitating the passage of fish up the Kymijoki). - Suomen Kalastuslehti, 38(12):213-218.
- 1937 Miten lohenkutu tapahtuu. (How salmon spawn). - Urheilukalastaja, No.1-3:7-11.
- 1938 Selostus Kokemäenjoen pato- ja nuottakalastuspaikkojen omistus- ja käyttöoikeudesta. (The right to own or use weir- or seine-fishing sites in the Kokemäenjoki). - Suomen Kalatalous, 12:1-92.
- 1948 Kalateista ja kalojen nousumahdollisuudesta vesivoimalaitospatojen ohi. (Fishways and opportunities for fish migration past hydro-electric dams). - Suomen Kalastuslehti, 55(2-3):28-34 and 48-50.
- 1949 Selostus vesivoimalaitoksien ja uiton kalastukselle tuottamasta vahingosta ja tämän torjumisesta. (Report on damage to fisheries caused by hydro-electric stations and timber floating and suggestions for its prevention). - Suomen Vesivoimayhdistys, p.1-94, Helsinki.
- 1954 Oulujoen keskuskalanviljelyslaitos. (The Oulujoki central fish hatchery). - Suomen Vesivoimayhdistys, 25:70-71, Helsinki.
- 1954 Toimenpiteistä lohikannan säilyttämiseksi. (Measures for the maintenance of salmon stock). - Suomen Kalastuslehti, 61:8-11.

Dahlström, Harri

- 1968 Lohi p.123-130 kirjassa Svärdson, G., Nilsson, N.-A., Dahlström, H. & Tuunainen, P.: Kalat, kalavesien hoito ja kalanviljely. (Salmon). Helsinki 1968.
- 1971 Våra vandringsfiskars öde. (The fate of anadromous fishes in Finland). - Finlands Natur, 7:4-5.

Dahlström, Harri and Tapani Sormunen

- 1964 Tutkimus Kymijoen itäisten suuhaarojen edustan merialueen kalastusoloista ja kalastosta. (Study of fishing conditions and fish stocks in the sea close to the eastern tributaries of the Kymijoki).- Kalataloussäätiön monistettuja julkaisuja, No.9: 1-78.
- 1965 Tutkimus Oulun edustan merialueen kalastusoloista ja kalastosta. (Study of fishing conditions and fish stock in the sea off the town of Oulu). Kalataloussäätiön monistettuja julkaisuja, No.10: 1-108.

Forsell, Fr.

1947. Itämeren lohisiima. (The salmon long line in the Baltic). - Suomen Kalastuslehti, 54:51-53.

Chers, Carl Robert

- 1771 Oeconomisk afhandling om orsaker til Cumá Krono Lax och Sik Fiskets förminsking, som ock de helpemedel som deremot kunna vidtagas. (Economic treatise on the reasons for the decline of salmon and white fish fisheries, and possible measures against it). p. 1-15, Åbo.

Grönroos, K.

- 1945 Noormarkunjoki korvaamaan Kokemäenjokea nousukalojen kutujokena. (The capacity of the Noormarkunjoki to substitute for the Kokemäenjoki as a spawning river for anadromous fishes). - Suomen Kalastuslehti, 52(5):68-69.

## Agreement between Denmark, the Federal Republic of Germany and Sweden on the protection of salmon in the Baltic

**Overenskomst angående beskyttelse af laksebestanden i Østersøen**

Kongeriget Danmark, Forbundsrepublikken Tyskland og Kongeriget Sverige er ud fra ønsket om at afslutte en overenskomst om beskyttelse af laksebestanden (*Salmo salar*) i Østersøen enedes om følgende:

**Artikel 1.**

Det område, på hvilket denne overenskomst finder anvendelse, omfatter Østersøen, herunder Den botniske Bugt og Finske Bugt. Dette område begrænses mod Øresund samt Store Bælt og Lille Bælt af følgende linier:

- a) Falsterbo fyr—Stevns fyr.
- b) Jungshoved—Bøgenæssand.
- c) Hestehoved fyr—Maddes klint.
- d) Skelby kirke—Flinthorne Odde.
- e) Kappel kirke—Gulstav.
- f) Ristingehale—Ærøhale.
- g) Skjoldnæs—Pøls Huk.
- h) Chr. d. X's bro ved Sønderborg.

**Artikel 2.**

Ingen bestemmelse i denne overenskomst må fortolkes således, at den gør indskrænkning i den eneret, der tilkommer en kontraherende parts skibe til at drive fiskeri i farvande, hvor fiskeriet udelukkende er undergivet den kontraherende parts højhedsret.

**Artikel 3.**

Ingen bestemmelse i denne overenskomst må fortolkes således, at

**Übereinkommen über den Schutz des Lachsbestandes in der Ostsee**

Das Königreich Dänemark, die Bundesrepublik Deutschland und das Königreich Schweden sind, in dem Wunsch ein Übereinkommen über den Schutz des Lachsbestandes (*Salmo salar*) in der Ostsee abzuschliessen, wie folgt übereingekommen:

**Artikel 1.**

Der Anwendungsbereich dieses Übereinkommens umfasst die Ostsee einschliesslich des Bottnischen Meerbusens und des Finnischen Meerbusens. Dieses Gebiet wird gegen den Øresund und den Grossen und den Kleinen Belt durch folgende Linien begrenzt:

- a) Falsterbo Feuer—Stevns Feuer.
- b) Jungshoved—Bøgenæssand.
- c) Hestehoved Feuer—Maddes Klint.
- d) Skelby Kirche—Flinthorne Odde.
- e) Kappel Kirche—Gulstav.
- f) Ristingehale—Ærøhale.
- g) Skjoldnæs—Pøls Huk.
- h) Christian X-Brücke bei Sønderborg.

**Artikel 2.**

Keine Bestimmung dieses Übereinkommens darf so ausgelegt werden, dass sie das ausschliessliche Recht von Schiffen einer Vertragspartei beeinträchtigt, Fischfang in Gewässern zu betreiben, in denen die Vertragspartei ausschliessliche Hoheitsgewalt über die Fischerei hat.

**Artikel 3.**

Keine Bestimmung dieses Übereinkommens darf so ausgelegt werden,

**Överenskommelse rörande skydd för beståndet av lax i Östersjön**

Konungariket Danmark, Förbundsrepubliken Tyskland och Konungariket Sverige, vilka önska träffa överenskommelse om åtgärder till skydd för beståndet av lax (*Salmo salar*) i Östersjön, ha överenskommit om följande:

**Artikel 1.**

Det område, på vilket denna överenskommelse äger tillämpning, omfattar Östersjön, vari inbegripes Bottniska Viken och Finska Viken. Detta område begränsas mot Øresund samt Stora och Lilla Bält av följande linjer:

- a) Falsterbo fyr—Stevns fyr.
- b) Jungshoved—Bøgenæssand.
- c) Hestehoved fyr—Maddes Klint.
- d) Skelby kyrka—Flinthorne Odde.
- e) Kappel kyrka—Gulstav.
- f) Ristingehale—Ærøhale.
- g) Skjoldnæs—Pøls Huk.
- h) Christian X:s bro i Sønderborg.

**Artikel 2.**

Ingen bestämmelse i denna överenskommelse skall anses inkräkta på den uteslutande rätt, som tillkommer fördragsslutande parts fartyg att bedriva fiske på vatten, varöver denna fördragsslutande part har uteslutande jurisdiktion med avseende å fisket.

**Artikel 3.**

Ingen bestämmelse i denna överenskommelse skall anses inkräkta

den gör indskrænkning i en kontraherende parts krav med hensyn til søterritoriets grænser.

#### Artikel 4.

Bestemmelserne i denne overenskomst finder anvendelse på alle de kontraherende parter tilhørende skibe, som befinder sig indenfor eller udenfor de farvande, i hvilke fiskefaget udelukkende ur undergivet en kontraherende parts højhedsret.

#### Artikel 5.

De kontraherende parter tillader ikke, at der til laksefiskeri med garn eller kroge benyttes redskaber, der har andre mål end de nedenfor nævnte:

Drivgarn til laksefangst skal være af en sådan beskaffenhed, at et fladt måleinstrument af en tykkelse på 2 millimeter let kan trækkes igennem det våde garns i længderetningen diagonalt udtrukne masker. Dette måleinstruments bredde skal forsåvidt angår drivgarn af naturlige fibre og drivgarn af syntetiske fibre udgøre henholdsvis 165 millimeter og 157 millimeter.

Drivgarn, der allerede er i brug, og hvis maskestørrelse er mindre end 170 millimeter (garn af naturlige fibre) henholdsvis mindre end 160 millimeter (garn af syntetiske fibre) kan, indtil de er slidt op, fortsat anvendes, dog ikke udover 5 år, regnet fra dagen for denne overenskomsts ikrafttræden.

dass sie die Ansprüche einer Vertragspartei bezüglich der Grenzen ihrer Hoheitsgewässer beeinträchtigt.

#### Artikel 4.

Die Bestimmungen dieses Übereinkommens sind auf alle Schiffe der Vertragsparteien anzuwenden, die sich innerhalb oder ausserhalb der Gewässer befinden, in denen eine Vertragspartei die ausschliessliche Hoheitsgewalt über die Fischerei hat.

#### Artikel 5.

Die Vertragsparteien werden nicht zulassen, dass bei der mit Netzen oder Angeln betriebenen Lachsfischerei Geräte benutzt werden, die andere als die nachstehend vorgeschriebenen Masse haben:

Treibnetze zum Fang von Lachsen müssen so beschaffen sein, dass ein flaches Messinstrument mit einer Stärke von 2 Millimetern leicht durch die diagonal in die Länge gezogenen Maschen des nassen Netzes gezogen werden kann. Die Breite dieses Messinstruments hat für Treibnetze aus Naturfasern 165 Millimeter, für Treibnetze aus synthetischen Fasern 157 Millimeter zu betrachten.

Treibnetze, die schon in Gebrauch sind und deren Maschengrösse kleiner als 170 Millimeter (Netze aus Naturfasern) bzw. kleiner als 160 Millimeter (Netze aus synthetischen Fasern) ist, dürfen weiter benutzt werden, bis sie aufgebraucht sind, jedoch nicht länger als 5 Jahre nach dem Tage des Inkrafttretens dieses Übereinkommens.

på någon fördragsslutande parts språk ifråga om gränserna för territorialvattnet.

#### Artikel 4.

Bestämmelserna i denna överenskommelse äga tillämpning på de fördragsslutande parternas samtliga fartyg, vilka befinna sig på eller utanför vatten, där den fördragsslutande parten har uteslutande jurisdiktion med avseende å fisket.

#### Artikel 5.

De fördragsslutande parterna skola icke tillåta att vid fiske efter lax med nät eller krok användas redskap med andra mått än som nedan angivas:

Laxdrivnäten skola vara så be-skaffade, att en flat mätsticka av 2 millimeters tjocklek lätt kan föras genom maskorna, när dessa är sträckta diagonalt i näts längdriktning och detta är vått. Bredden på detta mästinstrument skall för drivnät av naturfiber uppgå till 165 millimeter och drivnät av syntetiska fiber 157 millimeter.

Drivnät, som redan är i bruk och vars maskstorlek är mindre än 170 millimeter om näten är av natur-fiber respektive 160 millimeter om näten är av syntetiska fiber, få användas fortsättningsvis till dess de är utnötta, dock icke längre än 5 år efter dagen för denna överenskommelses ikraftträende.

Spændvidden for fiskekroge (korteste afstand mellem krogspids og skaft) i drivliner og faste liner, der anvendes til laksefangst, skal udgøre mindst 19 millimeter. Fiskekroge, der allerede er i brug, og hvis spændvidde udgør mindre end 19 millimeter, kan fortsat anvendes, dog ikke uddover 3 år, regnet fra dagen for denne overenskomsts ikrafttræden.

#### Artikel 6.

Intet skib må beholde laks ombord, som er fanget i de i artikel 1 angivne farvande, og som ikke har et mindstemål af 60 centimeter (målt fra snudespids til halefinnens yderste endepunkt). Sådanne laks skal straks igen udsættes i havet.

#### Artikel 7.

Enhver af de kontraherende parter forpligter sig til at fastsætte regler, der forbyder at islandbringe, tilbyde, i salgsøjemed opbevare, falbyde, sælge, på anden måde omsætte eller med videresalg for øje købe laks, der ikke har det i Artikel 6 angivne mindstemål. Et sådant forbud angår kun laks, der er fanget i de i artikel 1 i denne overenskomst angivne farvande.

#### Artikel 8.

Bestemmelserne i denne overenskomst finder ikke anvendelse på fiskefangst, der foregår til røgt og pleje af fiskebestanden eller til videnskabelige formål, og på de herved fangne laks. Sådanne laks kan islandbringes til videnskabelige formål; øvrigt finder artikel 7 anvendelse.

Die Spannweite der Angelhaken (kürzester Abstand zwischen Haken spitze und Schenkel) an Treibleinen und festen Leinen, die zum Fang von Lachsen verwendet werden, muss mindestens 19 Millimeter betragen. Angelhaken, die schon in Gebrauch sind und deren Spannweite weniger als 19 Millimeter beträgt, dürfen weiter verwendet werden, jedoch nicht länger als 3 Jahre nach dem Tage des Inkrafttretens dieses Übereinkommens.

#### Artikel 6.

Kein Schiff darf Lachse, die in den in Artikel 1 bezeichneten Gewässern gefangen worden sind, und nicht ein Mindestmass von 60 Zentimeter (gemessen von der Maulspitze bis zum äussersten Ende der Schwanzflosse) haben, an Bord behalten. Solche Lachse müssen sofort in die See zurückgeworfen werden.

#### Artikel 7.

Jede Vertragspartei wird Vorschriften erlassen, die verbieten, Lachse, die nicht das in Artikel 6 bezeichnete Mindestmass haben, anzuladen, anzubieten, zum Verkauf vorrätig zu halten, feilzuhalten, zu verkaufen, sonst in den Verkehr zu bringen oder zum Zweck des Weiterverkaufs zu kaufen. Ein solches Verbot bezieht sich nur auf Lachse, die in den in Artikel 1 dieses Übereinkommens bezeichneten Gewässern gefangen worden sind.

#### Artikel 8.

Die Bestimmungen dieses Übereinkommens beziehen sich nicht auf den Fischfang, der zur Pflege des Fischbestandes oder zu wissenschaftlichen Zwecken betrieben wird, und auf die dabei gefangenen Lachse. Solche Lachse dürfen für wissenschaftliche Zwecke angelandet werden; im übrigen findet Artikel 7 Anwendung.

Gapet på krok (kortaste avståndet mellan krokens spets och skaft) på drivlinor och fasta linor, som användas vid fiske efter lax, skall uppgå till minst 19 millimeter. Krokar, som redan är i bruk och vars gap är mindre än 19 millimeter, få användas fortsättningsvis, dock icke längre än 3 år efter dagen för denna överenskommelses ikraftträdande.

#### Artikel 6.

Inget fartyg må behålla ombord inom det i artikel 1 angivna vattenområdet fångad lax, vilken är mindre än 60 centimeter (mått från nosspetsen till stjärtfenans yttersta spets). Sådan lax skall omedelbart utsättas i havet.

#### Artikel 7.

Varje födragsslutande part skall utfärda föreskrifter med förbud att islandföra, utbjuda, för försäljningsändamål hålla i lager, saluhålla, sälja, på annat sätt föra i handeln eller i återförsäljningssyfte köpa lax, som understiger det i artikel 6 föreskrivna minimimåttet. Detta förbud gäller endast lax, som fångats i det i artikel 1 av denna överenskommelse angivna vattenområdet.

#### Artikel 8.

Bestämmelserna i denna överenskommelse skola icke äga tillämpning på fiske, som bedrives för fiskevårdande eller vetenskapliga ändamål, eller på lax, som fångas vid sådant fiske. Sålunda fångad lax må för vetenskapliga ändamål islandföras; i övrigt äger artikel 7 tillämpning.

### Artikel 9.

Enhver af de kontraherende parter forpligter sig til at fastsætte de til gennemførelsen af denne overenskomst nødvendige regler. Disse regler skal også være gældende for laksefangst i de farvande, i hvilke fiskeriet udelukkende er undergivet den kontrahedende parts højhedsret.

De kontraherende parter forpligter sig til at tilstille hinanden teksterne til de regler, der fastsættes til gennemførelsen af denne overenskomst.

### Artikel 10.

Der oprettes en stående kommission, i hvilken enhver af de kontraherende parter er repræsenteret ved et stemmeberettiget medlem. Enhver af de kontraherende parter kan desuden udpege sagkyndige og rådgivere. Kommissionen træffer sine beslutninger eenstemmigt.

Kommissionen har til opgave at etablere og samordne tekniske kontakter med mellemfolkelige organisationer, videnskabsmænd og de kontraherende parters forskningsinstitutter med det formål at fremme laksebestanden i Østersøen, genopbygningsmetoderne og den rationelle udnyttelse af laksebestanden. Kommissionen bør yderligere på grundlag af foreliggende materiale ytre sig om formålstjenligheden af ændringer i og tilføjelser til denne overenskomst og om fornødent forelægge de kontraherende parter passende forslag.

Kommissionen fastsætter selv sin forretningsorden.

### Artikel 9.

Jede Vertragspartei wird die zur Durchführung dieses Übereinkommens erforderlichen Vorschriften erlassen. Diese Vorschriften haben sich auch auf den Lachsfang in den Gewässern, in denen die Vertragspartei die ausschliessliche Hoheitsgewalt über die Fischerei hat, zu erstrecken.

Die Vertragsparteien werden sich die Texte der Vorschriften übermitteln, die zur Durchführung dieses Übereinkommens erlassen werden.

### Artikel 10.

Es wird ein Ständiger Ausschuss errichtet, in den jede Vertragspartei einen stimmberechtigten Vertreter entsendet. Jede Vertragspartei kann ausserdem Sachverständige und Berater benennen. Der Ausschuss fasst seine Beschlüsse einstimmig.

Der Ausschuss hat die Aufgabe, zur Förderung des Lachsbestandes in der Ostsee, der Reproduktionsverfahren und der rationellen Ausbeutung des Lachsbestandes technische Kontakte mit zwischenstaatlichen Organisationen, Forschungsinstituten der Vertragsparteien und Wissenschaftlern herzustellen und zu koordinieren. Der Ausschuss soll ferner unter Berücksichtigung des zur Verfügung stehenden Materials über die Zweckmässigkeit von Änderungen oder Ergänzungen dieses Übereinkommens beraten und erforderlichenfalls den Vertragsparteien entsprechende Vorschläge unterbreiten.

Der Ausschuss wird sich eine Verfahrensordnung geben.

### Artikel 9.

Varje födragsslutande part skall utfärda för denna överenskommelses efterlevnad erforderliga föreskrifter. Dessa föreskrifter skola även inbegripa fiske efter lax å vatten, varöver den födragsslutande parten har uteslutande jurisdiktion med avseende å fisket.

De födragsslutande parterna ska tillställa varandra texerna till de föreskrifter, som utfärdas för denna överenskommelses efterlevnad.

### Artikel 10.

Ett ständigt utskott skall upprättas, i vilket varje födragsslutande part skall representeras av ett röstberättigat ombud. Varje födragsslutande part kan härutöver utse sakkunniga och rådgivare. Utskottet fattar sina beslut enhälligt.

Utskottet har till uppgift att för främjandet av beståndet av lax i Östersjön, reproduktionsmetoderna och det rationella utnyttjandet av laxbeståndet utveckla och samordna tekniska kontakter med internationella organisationer, forskningsinstitut tillhörande de födragsslutande parterna och vetenskapsmän. Vidare skall utskottet på grundval av till förfogande stående material överväga, om det finnes skäl att företa ändringar eller tillägg till bestämmelserna i denna överenskommelse och om så erfordras avgiva förslag härom till de födragsslutande parterna.

Utskottet skall utarbeta sin egen arbetsordning.

Kommissionen træder sammen efter anmodning af en af de kontraherende parter, dog mindst een gang hvert 3. år.

Kongeriget Sveriges regering indkalder snarest muligt efter denne overenskomsts ikrafttræden kommissionen til dens første møde.

Enhver af de kontraherende parter afholder omkostningerne for vedkommende parts repræsentant, sagkyndige og rådgivere.

#### Artikel 11.

Overenskomsten skal ratificeres. Ratifikationsdokumenterne deponeses hos Kongeriget Sveriges regering.

Overenskomsten træder i kraft 2 måneder efter, at samtlige ratifikationsdokumenter er deponeret. Kongeriget Sveriges regering underretter de øvrige kontraherende parter om ratifikationsdokumenternes deponeering og overenskomstens ikrafttræden.

#### Artikel 12.

De kontraherende parter kan i fællesskab beslutte at indbyde andre stater til at tiltræde denne overenskomst. En på denne måde indbudt stats tiltrædelse sker ved deponeering af et tiltrædelsesdokument hos Kongeriget Sveriges regering.

Kongeriget Sveriges regering underretter de stater, som har undertegnet eller tiltrådt denne overenskomst om tidspunktet for deponeingen af tiltrædelsesdokumenterne.

Der Ausschuss tritt auf Antrag einer der Vertragsparteien zusammen, jedoch mindestens einmal innerhalb von 3 Jahren.

Die Regierung des Königreichs Schweden wird sobald wie möglich nach Inkrafttreten dieses Übereinkommens den Ausschuss zu seiner ersten Sitzung einberufen.

Jede Vertragspartei trägt die Kosten für ihren Vertreter, ihre Sachverständigen und ihre Berater.

#### Artikel 11.

Das Übereinkommen bedarf der Ratifikation. Die Ratifikationsurkunden werden bei der Regierung des Königreichs Schweden hinterlegt.

Das Übereinkommen tritt 2 Monate nach Hinterlegung sämtlicher Ratifikationsurkunden in Kraft. Die Regierung des Königreichs Schweden wird die übrigen Vertragsparteien von der Hinterlegung der Ratifikationsurkunden und vom Inkrafttreten des Übereinkommens unterrichten.

#### Artikel 12.

Die Vertragsparteien können gemeinsam beschliessen, andere Staaten zum Beitritt zu diesem Übereinkommen einzuladen. Der Beitritt eines auf diese Weise eingeladenen Staates erfolgt durch Hinterlegung der Beitrittsurkunde bei der Regierung des Königreichs Schweden.

Die Regierung des Königreichs Schweden wird diejenigen Staaten, die dieses Übereinkommen unterzeichnet haben oder ihm beigeetreten sind, über den Zeitpunkt der Hinterlegung der Beitrittsurkunden unterrichten.

Utskottet skall sammanträda på framställning av någon av de fördragsslutande parterna, dock minst en gång inom loppet av 3 år.

Konungariket Sveriges regering skall så snart som möjligt efter denna överenskommelses ikraftträdande kalla utskottet till dess första sammanträde.

Varje fördragsslutande part skall svara för kostnaderna för sitt ombud samt sina sakkunniga och rådgivare.

#### Artikel 11.

Denna överenskommelse skall ratificeras. Ratifikationsinstrumenten skola deponeras hos Konungariket Sveriges regering.

Överenskommelsen träder i kraft 2 månader efter det att samtliga ratifikationsinstrument deponerats. Konungariket Sveriges regering skall underrätta de övriga fördragsslutande parterna om deponeering av ratifikationsinstrumenten och om överenskommelsens ikraftträdande.

#### Artikel 12.

De fördragsslutande parterna kunnna gemensamt besluta att inbjuda andra stater att ansluta sig till denna överenskommelse. Anslutningen av en på detta sätt inbjuden stat sker genom deponeering av anslutningsdokument hos Konungariket Sveriges regering.

Konungariket Sveriges regering skall underrätta de stater, som undertecknat eller anslutit sig till denna överenskommelse, om tidpunkten för deponeingen av anslutningsdokumenten.

### Artikel 13.

Denne overenskomst kan, når der er forløbet 3 år fra dens ikrafttræden, opsiges ved skriftlig meddelelse til Kongeriget Sveriges regering. Opsigelsen har retsvirkning 12 måneder efter, at meddelelsen er kommet frem til Kongeriget Sveriges regering. Denne underretter de øvrige kontraherende parter om opsigelsen.

Til bekræftelse af dette har undertegnede befudlmægtigede underskrevet denne overenskomst og forsynet den med deres segl. Udfærdiget i Stockholm den 20. december 1962 i dansk, tysk og svensk affattelse, hvis ordlyd har samme gyldighed, i et originaleksemplar, der deponeres hos Kongeriget Sveriges regering. Denne tilstiller regeringerne i Kongeriget Danmark og Den tyske Forbundsrepublik bekræftede afskrifter af originaldokumentet.

### Artikel 13.

Dieses Übereinkommen kann nach Ablauf von 3 Jahren nach seinem Inkrafttreten durch schriftliche Mitteilung an die Regierung des Königreichs Schweden gekündigt werden. Die Kündigung wird 12 Monate nach Eingang der Mitteilung bei der Regierung des Königreichs Schweden wirksam. Diese wird die übrigen Vertragsparteien von der Kündigung unterrichten.

Zu Urkund dessen haben die unterzeichneten Bevollmächtigten dieses Übereinkommen unterschrieben und mit ihren Siegeln versehen. Geschehen in Stockholm am 20. Dezember 1962 in dänischer, deutscher und schwedischer Fassung, deren Wortlaut gleichermaßen verbindlich ist, in einer Urschrift, die bei der Regierung des Königreichs Schweden hinterlegt wird. Diese wird den Regierungen des Königreichs Dänemark und der Bundesrepublik Deutschland beglaubigte Abschriften der Urschrift übermitteln.

*E. Blytgen-Petersen*  
(L. S.)

*Dr. Karl Werkmeister*  
(L. S.)

*Torsten Nilsson*  
(L. S.)

### Artikel 13.

Denna överenskommelse kan, sedan 3 år förflutit efter det den trätt i kraft, uppsägas genom skriftligt meddelande till Konungariket Sveriges regering. Upprägningen blir giltig 12 månader efter det den mottagits av Konungariket Sveriges regering. Denna skall underrätta de övriga födragsslutande parterna om uppsägningen.

Till bekräftelse härav hava undertecknade befudlmäktigade ombud undertecknat denna överenskommelse och därpå anbragt sina sigill. Som skedde i Stockholm den 20 december 1962 på danska, tyska och svenska språken, vilka texter äga lika vitsord, i ett exemplar som skall deponeras hos Konungariket Sveriges regering. Denna skall sända bestyrkta avskrifter därav till Konungariket Danmarks och Förbundsrepubliken Tysklands regeringar.

Stockholm, 20 December 1962
