

Pollack (*Pollachius pollachius*) in subareas 6–7 (Celtic Seas and the English Channel)

ICES stock advice

Please note: Advice for 2019 was updated in 2018 (ICES, 2018) and advice for 2020 was updated in 2019 (ICES, 2019)

ICES advises that when the precautionary approach is applied, commercial catches should be no more than 4200 tonnes in each of the years 2018, 2019 and 2020. All commercial catches are assumed to be landed. ICES cannot quantify the recreational catches.

Stock development over time

The available information is insufficient to evaluate the exploitation and the trends of pollack in the Celtic Seas ecoregion. Official commercial landings have been stable since the early 1990s.

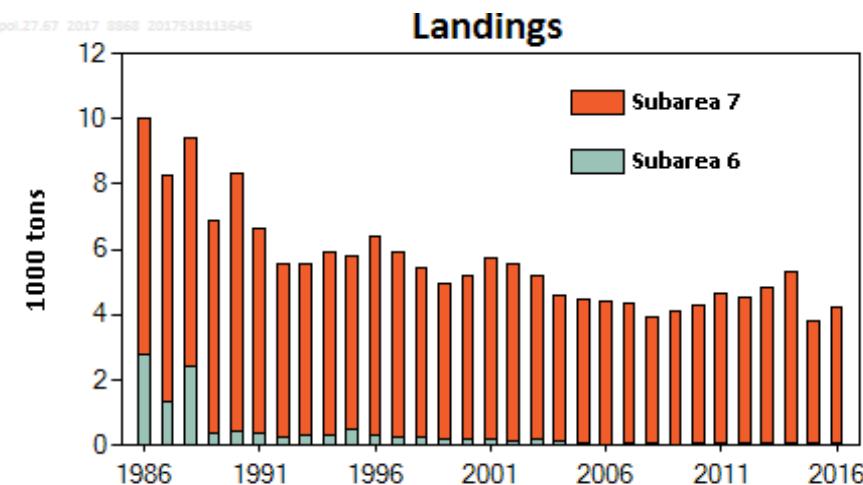

Figure 1 Pollack in subareas 6 and 7. Landings by subarea, as estimated by ICES.

Stock and exploitation status

Table 1 Pollack in subareas 6 and 7. State of the stock and fishery, relative to reference points. The qualitative evaluation is based on a depletion-corrected average catch (DCAC) analysis for Subarea 7 (98% of commercial catch; Figure 2).

	Fishing pressure			Stock size		
	2014	2015	2016	2014	2015	2016
Maximum sustainable yield	F_{MSY}	?	?	?	Unknown	?
Precautionary approach	F_{pa}, F_{lim}	?	?	?	Unknown	?
Management plan	F_{MGT}	—	—	—	Not applicable	—
Qualitative evaluation	-	✗	✓	✓	Below possible reference points	?
				MSY $B_{trigger}$?	?
				B_{pa}, B_{lim}	?	?
				B_{MGT}	—	—

Catch options

The ICES framework for category 4 stocks was applied (ICES, 2012). The depletion-corrected average catch (DCAC, which is interpreted as an approximation of MSY) method was used to provide catch advice for this stock. The ICES implementation of this method advises a reduction of catch when the stock catch is above the DCAC and, for this reason, an additional precautionary buffer is not needed. The perception of the stock has not changed; therefore, the advice given in the three most recent years is still applicable this year.

Table 2 Pollack in subareas 6-7. ICES framework for category 4 applied.

Recent advised commercial landings	4200 tonnes
Discard rate	Negligible
Precautionary buffer	Not applied
Commercial catches advice*	4200 tonnes

*recent advised commercial landings.

Basis of the advice

Table 3 Pollack in subareas 6–7. The basis of the advice.

Advice basis	Precautionary approach
Management plan	ICES is not aware of any agreed precautionary management plan for pollack in this area.

Quality of the assessment

The main uncertainty in the assessment is that the recreational catch is not included. Levrel *et al.* (2013) indicates that recreational catch could be a large component of total catch; 3300 tonnes of recreational fishery catches per year in France are estimated (2011–2013).

Further information on stock structure and biological parameters are needed before alternative assessment models can be applied.

Issues relevant for the advice

The ICES advice applies to commercial catches only. ICES cannot quantify the recreational catches but available estimates indicate that they are substantial. Although the overall TAC is not limiting, for some countries the quotas are limiting.

Reference points

No reference points are defined for this stock.

Basis of the assessment

Table 4 Pollack in subareas 6–7. The basis of the assessment.

ICES stock data category	4.1.2 (ICES 2016)
Assessment type	DCAC (depletion-corrected average catch)
Input data	Commercial landings
Discards and bycatch	Negligible (1.1% of catch)
Indicators	None
Other information	None
Working group	Working Group for the Celtic Seas Ecoregion (WGCSE)

Information from stakeholders

There is no additional available information for this stock.

History of advice, catch and management

Summary of the assessment

The depletion-corrected average catch (DCAC) method has been run with commercial landings. The estimation of the DCAC (MSY proxy) given by the method is 152 tonnes (with a 95% confidence interval from 113 to 184 tonnes) for Subarea 6, and 4063 tonnes (with a 95% confidence interval from 3262 to 4671 tonnes) for Subarea 7. This is consistent with the range of DCAC values estimated when the method was previously applied.

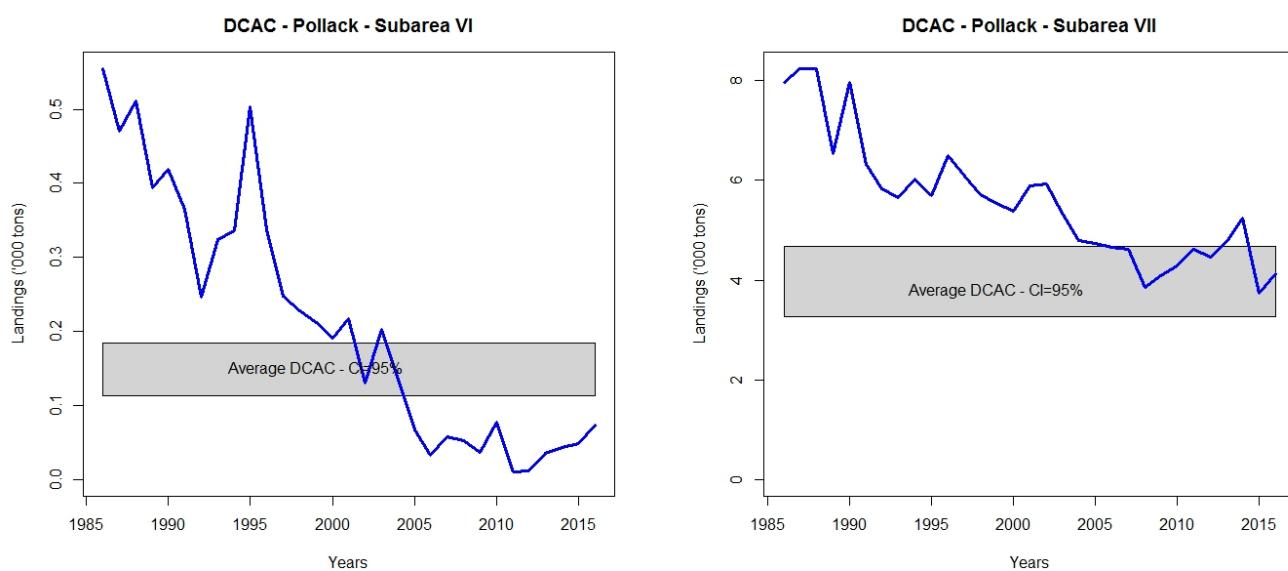

Figure 2 Pollack in subareas 6–7. The results of the depletion-corrected average catch (DCAC) assessment method as applied to commercial landings data since 1986. The grey box indicates the proxy for the maximum sustainable catch +/- 95% confidence intervals.
