

Whiting (Merlangius merlangus) in Division 7.a (Irish Sea)

ICES stock advice

ICES advises that when the MSY approach is applied, there should be zero catches in each of the years 2018 and 2019.

Stock development over time

The present stock size is extremely low. SSB has been declining since the start of the time-series and has been well below B_{lim} since the mid-1990s. Recruitment has been low since the early 1990s. Large variations in fishing pressure has been estimated in recent years and F has been above F_{lim} for the entire time-series.

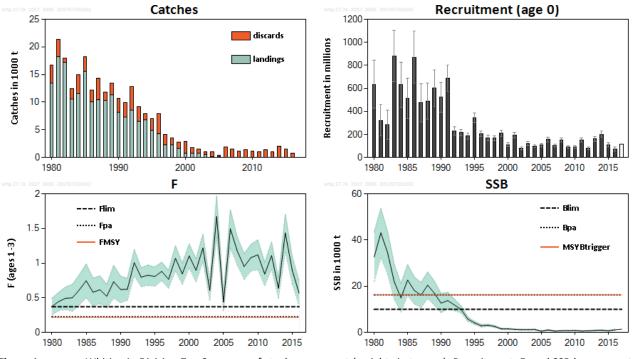

Figure 1Whiting in Division 7.a. Summary of stock assessment (weights in tonnes), Recruitment, F, and SSB have uncertainty
boundaries (1 × standard deviation) in the plot. The predicted recruitment value is not shaded.

** Landings in 2018 relative to TAC in 2017 (80 t).

[^] The B_{lim}, B_{pa}, and MSY B_{trigger} options were left blank because B_{lim}, B_{pa}, and MSY B_{trigger} cannot be achieved in 2019, even with zero advice.

Basis of the advice

| Table 4Whiting in Division 7.a. The basis of the advice. | | | | | | | |
|--|---|--|--|--|--|--|--|
| Advice basis MSY approach | | | | | | | |
| Management plan | ICES is not aware of any agreed precautionary management plan for whiting in this area. | | | | | | |

Quality of the assessment

This stock was benchmarked in January 2017. The result of the benchmark was that the stock was changed from a category 3 stock (trend-based assessment) to a category 1 stock (analytical assessment). The assessment includes information from the commercial fishery, including both landings and discards, and takes into account selectivity changes that occurred in 1995. Three survey series are used within the assessment. Natural mortality parameters were updated to reflect current stock dynamics. Despite the highly fluctuating fishing pressure in recent years (2002–present) it is clear from the assessment that the stock remains extremely low.

Issues relevant for the advice

The majority of whiting caught are discards in the *Nephrops* fishery and are below the minimum landings size. Despite the introduction of several technical measures to reduce fin fish catch and discards in the *Nephrops* fishery, the total discards estimates remain high. Given the continued high discards and low TAC this stock could become a major 'choke species' for the Division 7.a *Nephrops* fishery in the context of the landing obligation.
