Plaice (Pleuronectes platessa) in Division 7.d (eastern English Channel)

## ICES advice on fishing opportunities

ICES advises that when the MSY approach is applied, catches in 2019 should be no more than 7864 tonnes.

Assuming the same proportion of the Division 7.e and Subarea 4 plaice stocks is taken in Division 7.d as during 20032017, this will correspond to catches of plaice in Division 7.d in 2019 of no more than 9225 tonnes.

## Stock development over time

The spawning-stock biomass (SSB) has increased rapidly from 2010 following a period of high recruitment between 2009 and 2015, and is now well above the MSY Btriger. Fishing mortality (F) has declined since the early 2000s and it has been below $\mathrm{F}_{\mathrm{MSY}}$ since 2009. Recruitment (R) is currently around the average of the time-series.

Figure $1 \quad$ Plaice in Division 7.d. Summary of the stock assessment. Predicted values of recruitment are not shaded. Shaded areas ( $F$, SSB) and error bars ( R ) indicate $\pm 2$ standard errors (approximately $95 \%$ confidence intervals).

## Stock and exploitation status

ICES assesses that fishing pressure on the stock is below $\mathrm{F}_{\mathrm{ms}}, \mathrm{F}_{\mathrm{pa}}$, and $\mathrm{Flim}^{\text {; spawning-stock size }}$ is above MSY $\mathrm{B}_{\text {trigger, }} \mathrm{B}_{\mathrm{pa}}$, and Blim .

* "Wanted" and "unwanted" catch are used to describe fish that would be landed and discarded in the absence of the EU landing obligation, based on discard rate estimates for 2015-2017.
** SSB 2020 relative to SSB 2019.
*** Wanted catch in 2019 relative to the ICES estimates of landings in 2017 ( 3689 t) for the Division 7.d plaice stock.
\$ Total catch in 2019 relative to advice value 2018 (10 592 t) for the Division 7.d plaice stock.
$\wedge$ Differences between the total catch and the sum of wanted and unwanted catches are due to rounding.
$\wedge \wedge$ Wanted catch in 2019 relative to the ICES estimates of landings in 2017 (4613 t) for plaice caught in Division 7.d.
$\wedge \wedge \wedge$ Proposed EU multiannual plan (MAP) for the Western Waters (EU, 2016).

 wanted catch, and unwanted catch.
\#\# Total catch in 2019 relative to the Division 7.d proportion of the TAC in 2018 ( 7871 t ), assuming the same proportion of the TAC is taken from Division $7 . e$ as during $2003-2017$.
\#\#\# Total catch in 2019 relative to advice value 2018 (12 378 t) for plaice caught in Division 7.d.

[^0]ICES Advice 2018
 2019 and the historical proportion of the stock landings taken by the fleet):
A. Maximum scenario: Each fleet stops fishing when its last stock share is exhausted.
B. Minimum scenario: Each fleet stops fishing when its first stock share is exhausted.
C. COD: Each fleet stops fishing when its individual cod share is exhausted.
D. SQ (status quo) effort scenario: The effort of each fleet in 2018 and 2019 is as in 2017.
 each stock in the fleet's portfolio.
 pok.27.3a46; ple.27.420; ple.27.7d; sol.27.4; sol.27.7d).

The advice change is due to applying the same $F\left(F_{M S Y}\right)$ to an estimated stock size that is lower due to lower recruitment.

## Basis of the advice

Table $4 \quad$ Plaice in Division 7.d. The basis of the advice.

| Advice basis | ICES MSY approach |
| :--- | :--- |
| Management plan | The EU has proposed a multiannual management plan for the Western Waters, which is not yet finalized <br> (EU, 2018). |

## Quality of the assessment

There is uncertainty about the landing statistics of the Division 7.d plaice stock because of migrations between this area and the North Sea and the western English Channel during the spawning period. Stock structure and mixing rate during the spawning period need to be investigated, new data are needed to determine if the current mixing rate estimates are still valid given the general increase of plaice stocks. The current assessment results are dependent on the proportion of quarter 1 removals estimated from the historical tagging survey (ICES, 2010).

Figure $2 \quad$ Plaice in Division 7.d. Historical assessment results.

## Issues relevant for the advice

The EU is finalizing a MAP for the Western Waters, and ICES provided advice based on the ICES MSY approach.
Plaice is caught in a mixed fishery targeting sole, with 80 mm mesh size. This leads to a large number of plaice being discarded because this mesh size is not matched to the minimum conservation reference size (MCRS).

A single TAC covers both divisions 7.d and 7.e; management should ensure that fishing opportunities are in line with the stock status for each of the stocks in the combined management area in order to ensure that both stocks are exploited sustainably.

## Mixed-fisheries considerations ${ }^{\dagger \dagger}$

Results from a North Sea mixed-fisheries analysis are presented in the ICES mixed-fisheries advice (ICES, 2018a). The analysis has been updated taking into account latest changes made to the assessments and forecasts for stocks with reopened advice.

After years of positive development, North Sea cod is again estimated to be the most limiting stock in the Greater North Sea mixed-fisheries model. For 2019, assuming a strictly implemented landing obligation (corresponding to the "Minimum" scenario), cod is estimated to constrain 24 out of 40 fleet segments. Whiting is the second most limiting stock, constraining twelve fleet segments. Conversely, in the "Maximum" scenario, saithe and both plaice stocks (North Sea and eastern English Channel) would be the least limiting for 17, 9, and 3 fleet segments, respectively. Finally, if

[^1]Norway lobster were managed by separate TACs, Norway lobster in FU 7 would be the least limiting for seven fleet segments (ICES, 2018b).

For those demersal fish stocks for which the Fmsy range is available, a "range" scenario is presented that minimizes the potential for TAC mismatches in 2019 within the FMSy range. This scenario returns a fishing mortality by stock which, if used for setting single-stock fishing opportunities for 2019, may reduce the gap between the most and the least restrictive TACs, thus reducing the potential for quota over- and undershoots. This "range" scenario suggests that the potential for mixed-fisheries mismatch would be lowered with a 2019 TAC in the lower part of the FMsy range for North Sea plaice and North Sea saithe, and at the highest possible value for cod in accordance with the MSY approach and the MAP (EU multiannual plan).

## Reference points

|  | MAP range Flower | $0.175-0.25$ | Consistent with ranges provided by ICES (2015a), resulting in no more than 5\% reduction in long-term yield compared with MSY. |  |
|  | MAP range Fupper | 0.25-0.344 | Consistent with ranges provided by ICES (2015a), resulting in no more than 5\% reduction in long-term yield compared with MSY |  |

* Proposed EU multiannual plan (MAP) for the Western Waters (EU, 2018).

## Basis of the assessment

Table 6 Plaice in Division 7.d. Basis of the assessment and advice.

| ICES stock data category | 1 (ICES, 2018c). |
| :--- | :--- |
| Assessment type | Age-based analytical assessment (Aarts and Poos, 2009; ICES, 2018b) that uses catches in the model and <br> in the forecast (ICES, 2018d). |
| Input data | Commercial catch (international landings, with age frequencies from catch sampling covering 88\% of the <br> landings), two survey indices UK-BTS, FGFS. Constant natural mortality by age is calculated from Peterson <br> and Wroblewski (1984). Fixed maturity ogive is based on biological sampling. |
| Discards and bycatch | Discards are included in the assessment and all major fleets are covered. 79\% of the landings had <br> associated discard data in 2017, with age frequencies from catch sampling covering 72\% of the discards. <br> $73 \%$ of the discard estimates are based on observations. The model reconstructs discards for years where <br> data are not available (before 2006). |
| Indicators | None. |
| Other information | Last benchmarked in 2015 (WKPLE; ICES, 2015b). |
| Working group | Working Group on the Assessment of Demersal Stocks in the North Sea and Skagerrak (WGNSSK) |

* Plaice in Division 7.d, taking into account fish caught in the first quarter in Division 7.d that come from Division 7.e and Subarea 4 to spawn.
** Single-stock boundary and the exploitation of this stock should be conducted in the context of mixed fisheries.
*** Based on historical (2003-2017) proportion of landings in 7.e relative to 7.d,e

## History of the catch and landings

Table $8 \quad$ Plaice in Division 7.d. Catch distribution of 7.d plaice by fleet in 2017 as estimated by ICES.

| Catch (2017) | Wanted catch |  |  | Unwanted catch |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 7764 tonnes | $56 \%$ beam trawl | $27 \%$ otter trawl | $8.9 \%$ trammelnets | $8.1 \%$ other gears | 4075 tonnes |
|  | 3689 tonnes |  |  |  |  |

Table 9
Plaice in Division 7.d. History of commercial catch and landings; both the official and ICES estimated values are presented by area for each country participating in the fishery. All weights are in tonnes.

| Year | Belgium | France | UK(E+W) | Others | Official landings in 7.d | Unallocated in 7.d | ICES <br> estimated landings of plaice in 7.d | Quarter 1 removals $\wedge$ | ICES estimated landings for 7.d plaice ^ | ICES <br> estimated landings for plaice in 7.e | Agreed TAC for 7.d,e * |
