Capelin (Mallotus villosus) in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$ (Iceland and Faroes grounds, East Greenland, Jan Mayen area)

## ICES advice on fishing opportunities

ICES advises that when the harvest control rule agreed by the Coastal States is applied, the initial TAC for the fishing season July 2019-March 2020 should be zero tonnes.

## Stock development over time

The spawning-stock biomass (SSB) was estimated at 364000 tonnes at the time of spawning in March 2018, which corresponds to $95 \%$ probability of the SSB being above Blim (150 000 t ). The estimates from the acoustic survey in autumn 2018 of the immature 1-and 2-year-old capelin are low.

Figure $1 \quad$ Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. Summary of the stock assessment. Catches (thousand t) by fishing season (July-March of the following year). Recruitment (immature-at-age 1 and 2; numbers in billions) as acoustic index from autumn surveys (unshaded bars indicate incomplete spatial coverage likely resulting in notable underestimation), and SSB (thousand t , with $90 \%$ confidence intervals for the last two years) at spawning time (March-April). Note that the SSB values for 2016 and onwards are not directly comparable to historical values because they are based on different assumptions about natural mortality.

## Stock and exploitation status

Table 1 Capelin in subareas 5 and 14 and Division $2 . a$ west of $5^{\circ} \mathrm{W}$. State of the stock and fishery relative to reference points.

## Catch scenarios

Table 2 Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. Assumptions made for the interim year and in the forecast.

| Variable | Value | Notes |
| :--- | :---: | :--- |
| Immature age 1 (2017 year class) | 10.3 billion | Index from the autumn acoustic survey 2018 |
| Immature age 2 (2016 year class) | 0.4 billion | Index from the autumn acoustic survey 2018 |

Table 3 Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. The catch scenarios.

| Basis | Catches in 2019/2020 (t) |
| :--- | :--- |
| ICES advice basis |  |
| Harvest control rule agreed by the Coastal States (precautionary <br> approach for initial TAC). | 0 |

## Basis of the advice

The basis of the advice is the harvest control rule agreed by the Coastal States in 2015 (Anon., 2015). This implies applying the advice rule established by ICES in 2015 (ICES, 2015) for setting an initial TAC on the basis of immature abundance (ages 1-2) in the autumn acoustic survey (Figure 2). ICES recommends that the initial TAC is revised based on acoustic survey information in autumn 2019 (intermediate TAC), with the final TAC being set based on the results of the autumn and/or winter surveys in 2019/2020.

Figure 2
Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. Catch advice (initial TAC) according to the rule developed by ICES based on the measured number of immature capelin the previous autumn (about 16 months earlier than the winter survey used for the final TAC; ICES, 2015). The predicted final TAC is shown as the black solid line (based on immature index and the final TAC for the period 1980-2006) and the initial TAC as the blue dashed line. The latter is set using an index abundance trigger point (Utrigger, red vertical line) of 50 billion immature fish, with a cap on the initial TAC of 400000 t . The green lines show the index value from the autumn acoustic survey in 2018, with the corresponding initial TAC for 2019/2020 shown on the $y$-axis.

Table 4 Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. The basis of the advice.

| Advice basis | Harvest control rule agreed by the Coastal States (precautionary approach for initial TAC) |
| :--- | :--- |
| Management plan | The Coastal States (Iceland, Greenland, and Norway), have agreed (Anon., 2015) to use the following <br> harvest control rule as the basis for management: an initial TAC is set following the rule developed <br> by ICES (2015), with a very low probability of being higher than a regression estimated final TAC. This <br> is followed by an intermediate TAC set in the autumn and a final TAC set in winter, which will lead to <br> $>95 \%$ probability of SSB being greater than or equal to Blim at spawning time in the following spring. |

## Quality of the assessment

The autumn survey in 2018 had extensive spatial coverage. Hence, the observed low abundance estimates of immature fish is considered a reliable estimate.

## Issues relevant for the advice

This initial catch advice (TAC advice) is for the period July 2019 to March 2020. ICES is only requested to provide initial catch advice and the Marine and Freshwater Research Institute in Iceland is expected to provide updated catch advice based on acoustic survey information in autumn 2019 and winter 2019/2020 to form the basis for the final TAC for 2019/2020.

## Reference points

Table 5 Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. Reference points, values, and their technical basis.

| Framework | Reference points | Value | Technical basis | Source |
| :---: | :---: | :---: | :---: | :---: |
| MSY approach | MSY $\mathrm{B}_{\mathrm{trigger}}$ |  |  |  |
|  | $\mathrm{F}_{\mathrm{MSY}}$ |  |  |  |
|  | $\mathrm{B}_{\text {lim }}$ |  |  |  |
| Management plan | $\mathrm{B}_{\mathrm{pa}}$ | 150000 t | $\mathrm{B}_{\text {loss }}$ | ICES (2015) |
|  | $\mathrm{F}_{\mathrm{lim}}$ |  |  |  |
|  | $\mathrm{F}_{\mathrm{pa}}$ |  |  |  |

## Basis of the assessment

Table 6 Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. Basis of the assessment and advice.

| ICES stock data category | 1 (ICES, 2018a). |
| :--- | :--- |
| Assessment type | The initial TAC advice is set by applying an advice rule designed to ensure a low risk of advised catch <br> being higher than the final TAC (see WKICE; ICES, 2015). The final TAC advice is produced by Iceland, <br> based on a model which takes into account uncertainty in surveys and predation from cod, haddock, <br> and saithe on capelin to ensure that the advised catch will result in a less than 5\% chance of SSB going <br> below Blim. |
| Input data | The abundance estimate of immature capelin of ages 1 and 2 from acoustic surveys in autumn; <br> preliminary cruise report (ICES, 2018b). |
| Discards and bycatch | Not included, considered negligible. |
| Indicators | None. |
| Other information | Last benchmarked in 2015 (ICES, 2015). |
| Working group | North-Western Working Group (NWWG) |

## Summary of the assessment

Table 10
Capelin in subareas 5 and 14 and Division 2.a west of $5^{\circ} \mathrm{W}$. Assessment summary. Weights are in tonnes. For a fishing season $\mathrm{Y} / \mathrm{Y}+1$ the recruitment column refers to the autumn of year Y and SSB columns refer to the spring of $\mathrm{Y}+1$.

| Fishing season | Recruitment index (immature ages 1 and 2) | $\begin{gathered} \text { SSB* }^{*} \\ \text { (median value) } \end{gathered}$ | SSB* <br> 95th percentile | SSB* <br> 5th percentile | Historical SSB estimates | Catch |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | thousands | tonnes |  |  | tonnes | tonnes |
