## Ling (Molva molva) in Division 5.a (Iceland grounds)

## ICES advice on fishing opportunities

ICES advises that when the Icelandic management plan is applied, catches in the fishing year 1 September 2019 to 31 August 2020 should be no more than 6599 tonnes.

## Stock development over time

Recruitment was high from 2004 to 2012, but has since declined to the levels of the 1980s and 1990s. The spawning-stock biomass (SSB) and the reference biomass (ling longer than 75 cm ) in 2019 is close to the highest in the time-series. The harvest rate (HR) has decreased since 2008 and is now the lowest in the time-series, slightly below HRMSY.

Figure 1 Ling in Division 5.a. Summary of the stock assessment. In the lower right panel (SSB), the B75+ line represents the trend in the biomass of ling at 75 cm and greater that is used in the harvest control rule.

## Stock and exploitation status

ICES assesses that fishing pressure on the stock is slightly below $H R_{\text {MSY }}$ and that spawning-stock size is above MSY $\mathrm{B}_{\text {trigger }}$ $B_{\text {lim, }}$ and $B_{p a}$.

Table 1 Ling in Division 5.a. State of the stock and fishery relative to reference points. The determination of the symbols for fishing pressure under the management plan is based on the expected range of realized $H R$ ( 0.12 to 0.28 ), following the management plan ( $\mathrm{HR}_{\mathrm{MGT}}$; see ICES, 2017a).

|  | Fishing pressure |  |  |  |  | Stock size |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 2016 | 2017 |  | 2018 |  | 2017 | 2018 | 2019 |
| Maximum sustainable yield | $\mathrm{HR}_{\mathrm{MSY}}$ | - | $\checkmark$ | ( | Below | MSY <br> $B_{\text {trigger }}$ |  |  | - Above trigger |
| Precautionary approach | $\mathrm{HR}_{\mathrm{pa}}, \mathrm{HR}_{\text {lim }}$ |  |  |  | Harvested sustainably | $\mathrm{B}_{\mathrm{pa}}, \mathrm{B}_{\text {lim }}$ | $\checkmark$ | - | Full reproductive capacity |
| Management plan | $\mathrm{HR}_{\text {MGT }}$ | ) | ( | $\checkmark$ | Within the range | $\begin{aligned} & \text { MGT } \\ & \text { B }_{\text {trigger }} \end{aligned}$ |  |  | ( Above |

ICES Advice 2019 - lin. $27.5 a$ - https://doi.org/10.17895/ices.advice. 4816
ICES advice, as adopted by its Advisory Committee (ACOM), is developed upon request by ICES clients (European Union, NASCO, NEAFC, and Norway).

## Catch scenarios

The basis of the catch scenarios for this stock is the management plan. A catch scenario is provided for the fishery year from 1 September 2019 to 31 August 2020, based on the estimated reference biomass at the end of quarter 1 in 2019. A short-term forecast to the end of 2020 is provided to evaluate the impact of the advised catch on the SSB.

Table 2 Ling in Division 5.a. Assumptions made for the interim year and in the forecast.

| Variable | Value | Notes |
| :--- | :---: | :--- |
| HR 2019 | 0.180 | Assumed exploitation rate in 2019. |
| Reference biomass 2019 | 36660 | Biomass of fish 75 cm and larger (75+) at the end of quarter 1; in tonnes. |
| SSB 2019, Q1 | 35812 | SSB at the end of quarter 1 estimated by the model; in tonnes. |
| SSB 2020, Q1 | 35284 | SSB at the end of quarter 1 resulting from application of HR 2019; in tonnes. |
| $R_{\text {age } 3 \text { (2019) }}$ | 3180 | Estimated by the model; in thousands. |
| $R_{\text {age } 3}$ (2020) | 3407 | Average of last three years of recruitment; in thousands. |
| Catch (2019, sum of quarters 2 \& 3) | 3231 | Remainder of the TAC for the fishing year 2018/2019; in tonnes. |

Table 3 Ling in Division 5.a. Annual catch scenario. All weights are in tonnes.

| Basis | Total catch <br> $(2019 / 2020)$ | HR (2020) | SSB (2021) | \% SSB change * | \% TAC change ** | \% Advice change <br> $* * *$ |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Management <br> plan $\wedge$ | 6599 | 0.18 | 34606 | $-2 \%$ | $5 \%$ | $5 \%$ |

* SSB in 2021 relative to SSB in 2020.
** Advice value for 2019/2020 relative to the TAC in 2018/19 (6 255 t).
*** Advice value for 2019/2020 relative to advice value for 2018/19 (6 255 t ).
${ }^{\wedge}$ SSB in 2019 is above MGT $B_{\text {trigger, }}$, therefore the TAC is $H R_{M G T} \times B_{R e f, 2019}=0.18 \times 36660$.
The advice has increased from last year due to an upward revision of recent biomass levels.

## Basis of the advice

Table 4 Ling in Division 5.a. The basis of the advice.

| Advice basis | Management plan (ICES, 2017a). |
| :---: | :---: |
| Management plan | The Icelandic Ministry of Industries and Innovation's fisheries management plan for Icelandic ling has been evaluated by ICES (ICES, 2017a). It is considered to be precautionary and conforms to the ICES MSY approach. According to the management plan the TAC for the fishing year $\mathrm{Y} / \mathrm{Y}+1$ (1 September of year $Y$ to 31 August of year $\mathrm{Y}+1$ ) is calculated as follows: <br> When $S S B_{Y}$ is equal or above $M G T B_{\text {trigger: }}$ : $T A C_{Y / y+1}=H R_{M G T} \times{ }^{*} B_{R e f, y}$ <br> When SSB is $_{Y}$ below MGT $B_{\text {trigger: }}$ $T A C_{Y / y+1}=H R_{M G T} *\left(S S B_{y} / M G T B_{\text {trigger }}\right) * B_{r e f, y}$ <br> The spawning stock biomass trigger (MGT $B_{\text {trigger }}$ ) is defined as 9.93 kt , the reference biomass is defined as the biomass of ling $75+\mathrm{cm}$ and the target harvest rate $\left(H R_{M G T}\right)$ is set to 0.18 . |

## Quality of the assessment

Figure 2 Ling in Division 5.a. Historical assessment results. Only the three assessments since the 2017 benchmark are shown. Final-year recruitment and biomass estimates are included.

## Issues relevant for the advice ${ }^{\dagger}$

This stock is classified as Category 4 in the NEAFC categorization of deep-sea species/stocks which implies that fisheries are primarily restricted to Coastal State exclusive economic zones (EEZs) and therefore management measures are not taken by NEAFC unless complementary to coastal state conservation and management measures.

## Reference points

Table 5 Ling in Division 5.a. Reference points, values, and their technical basis.

| Framework | Reference point | Value | Technical basis | Source |
| :---: | :---: | :---: | :---: | :---: |
| MSY approach | MSY $\mathrm{B}_{\text {triger }}$ | 9930 | $\mathrm{B}_{\text {pa }}$ (tonnes). | ICES (2017b) |
|  | $\mathrm{F}_{\text {MSY }}$ | 0.28 | Stochastic simulations. | ICES (2017b) |
|  | HR MSY | 0.24 | Stochastic simulations. | ICES (2017b) |
| Precautionary approach | Blim | 7090 | $\mathrm{B}_{\mathrm{pa}} / 1.4$ (tonnes). | ICES (2017b) |
|  | $\mathrm{B}_{\mathrm{pa}}$ | 9930 | $\mathrm{B}_{\text {loss }}$ (tonnes). | ICES (2017b) |
|  | Flim | 0.70 | Equilibrium F that will maintain the stock above $\mathrm{Blim}_{\text {lim }}$ with a $50 \%$ probability. | ICES (2017b) |
|  | $\mathrm{F}_{\mathrm{pa}}$ | 0.41 | $5 \%$ probability that the true F has been above Flim. | ICES (2017b) |
|  | HR $\mathrm{lim}_{\text {m }}$ | 0.56 | Equilibrium HR that will maintain the stock above Blim with a $50 \%$ probability. | ICES (2017b) |
|  | $\mathrm{HR}_{\mathrm{pa}}$ | 0.35 | $5 \%$ probability that the true HR has been above $\mathrm{HR}_{\text {lim }}$. | ICES (2017b) |
| Management plan | MGT Btrigger | 9930 | $\mathrm{B}_{\text {pa }}$ (tonnes). | ICES (2017b) |
|  | HR MGT | 0.18 | Percentage of biomass $75+\mathrm{cm}$. Leads to above $95 \%$ of long-term MSY. Realized HR can range from 0.12 to 0.28 . | ICES (2017b) |
