

Haddock (*Melanogrammus aeglefinus*) in Division 5.b (Faroes grounds)

ICES advice on fishing opportunities

ICES advises that when the MSY approach is applied, catches in 2020 should be no more than 11 590 tonnes. ICES is not in a position to advise on the corresponding level of fishing effort.

Stock development over time

The spawning-stock biomass (SSB) was below B_{lim} in 2009–2017 but has been above $MSY B_{trigger}$ since 2018. The fishing mortality (F) has decreased in recent years and was just below F_{MSY} in 2018. The recruitment in 2016–2019 was higher than in previous years.

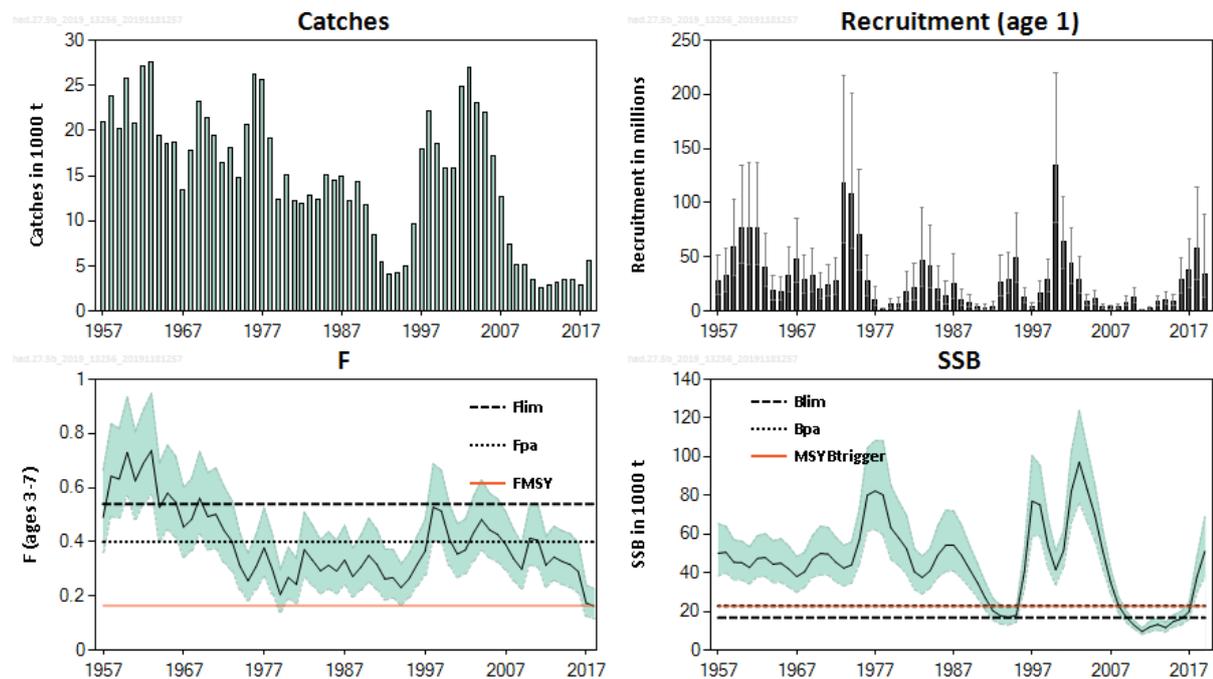

Figure 1 Haddock in Division 5.b (Faroes grounds). Summary of the stock assessment with 95% confidence intervals.

Stock and exploitation status

ICES assesses that fishing pressure on the stock is below F_{MSY} , F_{pa} , and F_{lim} , while the spawning-stock size is above $MSY B_{trigger}$, B_{pa} , and B_{lim} .

Table 1 Haddock in Division 5.b (Faroes grounds). State of the stock and fishery relative to reference points.

	Fishing pressure			Stock size				
	2016	2017	2018	2017	2018	2019		
Maximum sustainable yield	F_{MSY}	✗	✗	✓	Below			
Precautionary approach	F_{pa}, F_{lim}	✓	✓	✓	Harvested sustainably			
Management plan	F_{MGT}	—	—	—	Not applicable			
				$MSY B_{trigger}$	✗	✓	✓	Above trigger
				B_{pa}, B_{lim}	○	✓	✓	Full reproductive capacity
				B_{MGT}	—	—	—	Not applicable

Catch scenarios

Table 2 Haddock in Division 5.b (Faroes grounds). Assumptions made for the interim year and in the forecast. All weights are in tonnes.

Variable	Value	Notes
$F_{ages\ 3-7}$ (2019)	0.163	$F_{2019} = F_{2018}$
SSB (2020)	86423	Based on $F_{2019} = 0.163$
$R_{age\ 1}$ (2020)	10386	In thousands. Median of resampled estimates from 2000–2018
$R_{age\ 1}$ (2021)	10386	In thousands. Median of resampled estimates from 2000–2018
Total catch (2019)	7798 tonnes	Based on $F_{2019} = 0.163$
Landings (2019)	7798 tonnes	Landings = catches
Discards (2019)	0 tonnes	Negligible

Table 3 Haddock in Division 5.b (Faroes grounds). Annual catch scenarios. All weights are in tonnes.

Basis	Total catch (2020)	F_{total} (2020)	SSB (2021)	% SSB change *	% Advice change **
ICES advice basis					
MSY approach: F_{MSY}	11590	0.165	103925	20	57
Other scenarios					
$F = 0$	0	0	118336	37	-100
$F = F_{2019}$	11460	0.163	104167	21	56
$F = F_{pa}$	25104	0.40	87188	1	241
$F = F_{lim}$	31839	0.54	78443	-9	332

* SSB 2021 relative to SSB 2020 (86 423 t).

** Advice value 2020 relative to advice value for 2019 as issued in 2018 (7366 t).

The catch advice for 2020 has increased compared to the advice for 2019; this is due to the increase in biomass resulting from the higher recruitment and lower fishing mortality in recent years.

Basis of the advice

Table 4 Haddock in Division 5.b (Faroes grounds). The basis of the advice.

Advice basis	MSY approach
Management plan	ICES is not aware of any agreed precautionary management plan for haddock in this area.

Quality of the assessment

The stock was benchmarked in 2017, when the assessment model and input data were changed. The 2018 recruitment estimate has been reduced significantly in the latest assessment.

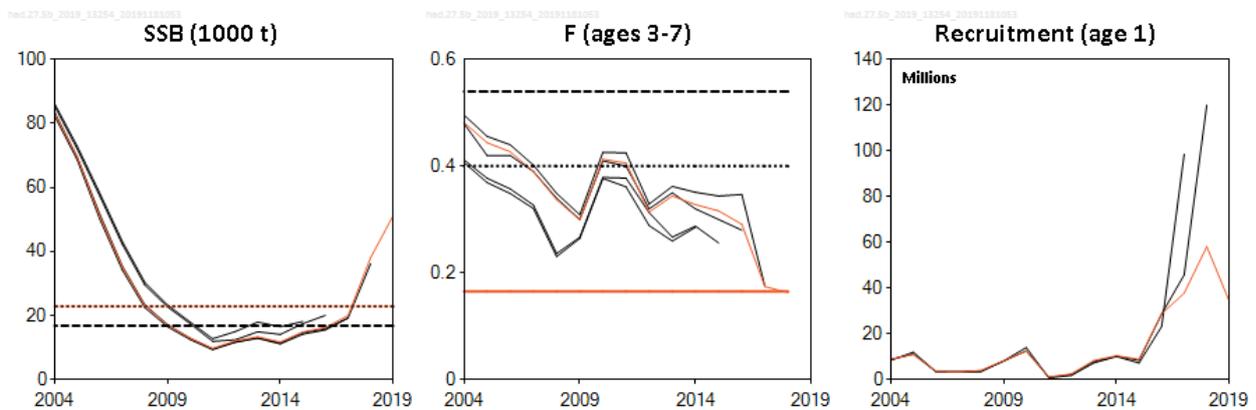

Figure 2 Haddock in Division 5.b (Faroes grounds). Historical assessment results. The age of recruitment changed from age 2 to age 1 at the 2017 benchmark; the recruitment plot therefore shows only three lines.

Issues relevant for the advice

An effort management system has been in place since 1996. ICES is currently not in a position to quantify the relationship between effort and F for this stock.

Faroe Plateau cod and Faroe haddock are caught in a mixed fishery.

Reference points

Table 5 Haddock in Division 5.b (Faroes grounds). Reference points, values, and their technical basis.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	22 843 t	B_{pa}	ICES (2017)
	F_{MSY}	0.165	Stochastic simulations based on a segmented regression stock–recruitment relationship.	ICES (2017)
Precautionary approach	B_{lim}	16 780 t	The lowest biomass that has led to good recruitment.	ICES (2017)
	B_{pa}	22 843 t	$B_{lim} \times \exp(1.645 \times \sigma)$, where $\sigma = 0.19$.	ICES (2017)
	F_{lim}	0.54	Stochastic simulations (ICES, 2017) that give a 50% probability of $SSB > B_{lim}$.	ICES (2017)
	F_{pa}	0.40	$F_{lim} \times \exp(-1.645 \times \sigma)$, where $\sigma = 0.18$.	ICES (2017)
Management plan	SSB_{mgt}	Not applicable		
	F_{mgt}	Not applicable		

Basis of the assessment

Table 6 Haddock in Division 5.b (Faroes grounds). Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2018a).
Assessment type	SAM with catch-at-age data and age-disaggregated indices, using catches in the model and in the forecast (ICES, 2019).
Input data	Commercial catches (mainly Faroese catches, ages and length frequencies from catch sampling); survey indices (FO-GFS-Q1 and FO-GFS-Q3); annual maturity data from FO-GFS-Q1; natural mortality set at 0.2.
Discards and bycatch	Discarding is considered negligible.
Indicators	Co-occurrence of high recruitment of haddock with sandeel abundance.
Other information	Benchmarked in 2017 (ICES, 2018b).
Working group report	North-Western Working Group (NWWG)

Information from stakeholders

There is no additional available information.

History of the advice, catch, and management

Table 7 Haddock in Division 5.b (Faroes grounds). ICES advice and catch. All weights are in tonnes.
