

## Witch (*Glyptocephalus cynoglossus*) in Subarea 4 and divisions 3.a and 7.d (North Sea, Skagerrak and Kattegat, eastern English Channel)

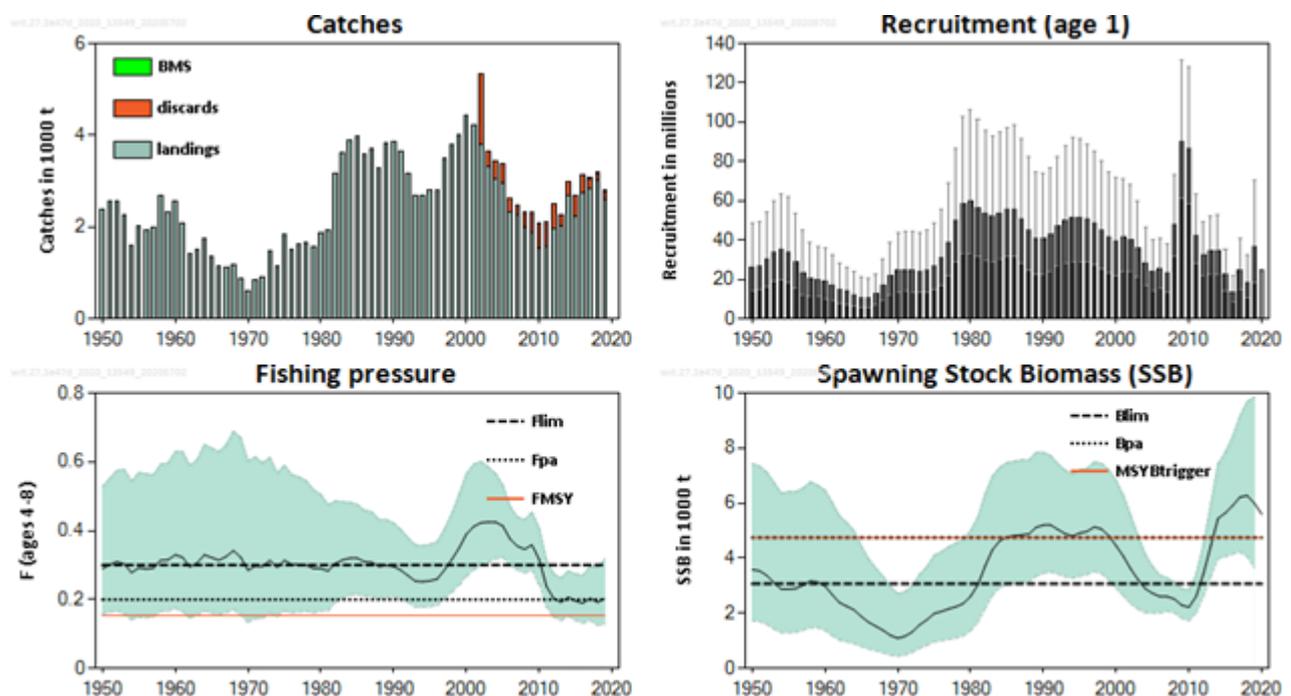

### ICES advice on fishing opportunities

ICES advises that when the MSY approach is applied, catches should not be more than 1733 tonnes.

Management of witch and lemon sole under a combined species TAC prevents effective control of the single-species exploitation rates and could lead to the overexploitation of either species. ICES advises that management should be implemented at the species level in the entire stock distribution area (Subarea 4 and divisions 3.a and 7.d).

Note: This advice sheet is abbreviated due to the COVID-19 disruption. The previous advice issued for 2020 is attached as Annex 1.

### Stock development over time

**Figure 1** Witch in Subarea 4 and divisions 3.a and 7.d. Official landings and discards (in thousand tonnes); discard information is available from 2002. The shaded areas on the spawning-stock biomass (SSB) and fishing pressure (F) plots, and the error bars on the recruitment (R) plot represent 95% confidence intervals. The assumed recruitment for 2020 is unshaded. SSB is estimated at the middle of the year (i.e. spawning time). Landings below minimum conservation reference size (BMS) are those officially reported.

### Stock and exploitation status

**Table 1** Witch in Subarea 4 and divisions 3.a and 7.d. State of the stock and the fishery relative to reference points.

	Fishing pressure			Stock size						
	2017	2018	2019	2018	2019	2020

# Annex 1

## Witch (*Glyptocephalus cynoglossus*) in Subarea 4 and divisions 3.a and 7.d (North Sea, Skagerrak and Kattegat, eastern English Channel)

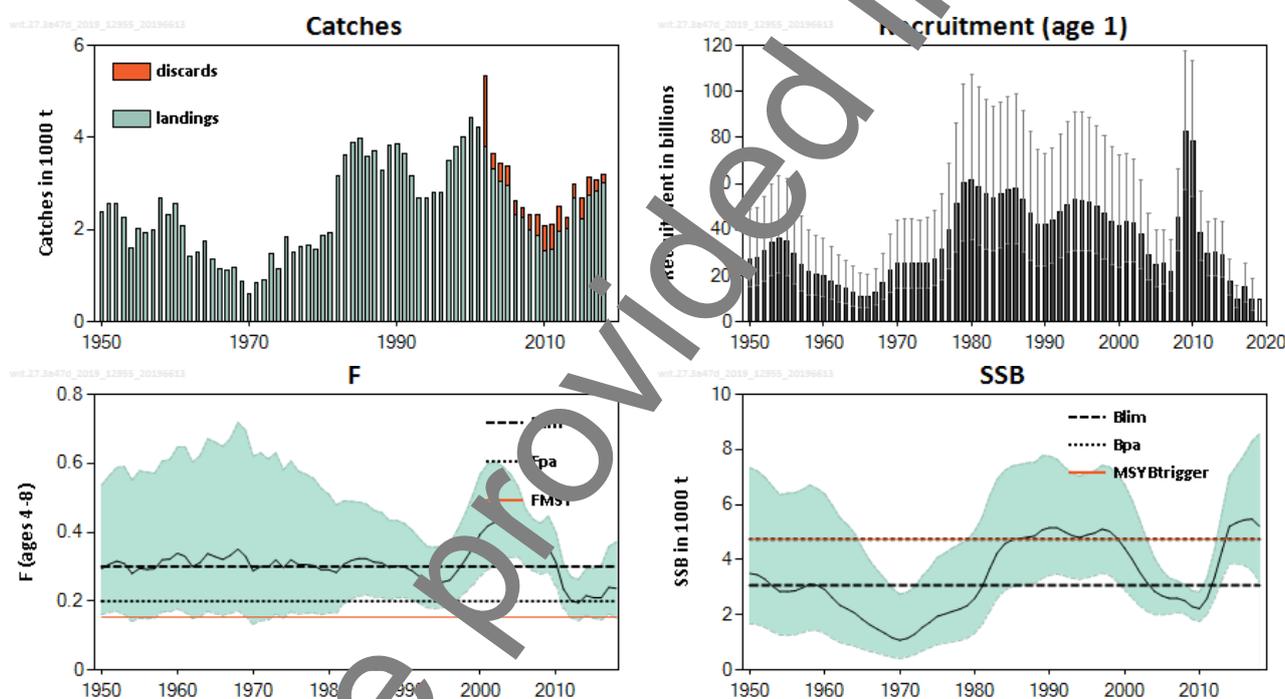

### ICES advice on fishing opportunities

In the context of the EU multiannual plan for demersal fisheries in the North Sea, in which this stock is considered bycatch, the EC has requested that ICES provide advice based on the precautionary approach. ICES advises that catches of up to 1651 tonnes are considered to be precautionary.

ICES advises that witch should be managed using a single-species TAC covering the entire stock distribution area (i.e. ICES Division 3.a, Subarea 4, and Division 7.d).

### Stock development over time

Fishing mortality (F) has been above  $F_{MSY}$  since the beginning of the time-series. Spawning-stock biomass (SSB) that was below  $B_{lim}$  around 2010, has increased since then and is now above  $MSY_{Btrigger}$ . Recruitment (R) has declined since 2010 and is currently at a low level.

**Figure 1** Witch in Subarea 4 and divisions 3.a and 7.d. Official landings and discards (in thousand tonnes); discard information is available since 2002. SSB, F, and R are shown with 95% confidence intervals. Assumed recruitment is unshaded. SSB is estimated at the middle of the year (i.e. spawning time).

**Stock and exploitation status**

ICES assesses that fishing pressure on the stock is above  $F_{MSY}$  and between  $F_{pa}$  and  $F_{lim}$ , and that spawning stock size is above  $MSY B_{trigger}$ ,  $B_{pa}$ , and  $B_{lim}$ .

**Table 1** Witch in Subarea 4 and divisions 3.a and 7.d. State of the stock and fishery relative to reference points.

		Fishing pressure			Stock size		
		2016	2017	2018	2016	2017	2018
Maximum sustainable yield	$F_{MSY}$	✘	✘	✘ Above	$MSY B_{trigger}$	✔	✔ Above trigger

\* “Wanted” and “unwanted” catch are used to describe fish that would be landed and discarded in the absence of the EU landing obligation, based on average discard rate estimates for 2016–2018.

\*\* SSB in 2021 relative to SSB in 2020.

\*\*\* Total catch in 2020 relative to advice value 2019 (2390 tonnes).

The change in advice (-31%) is due to a changed perception of the stock following a benchmark in 2018 (ICES, 2018a), during which the advice basis for witch changed from a category 3 to a category 1 stock.

<sup>†</sup> Version 2. FMSY upper scenario updated.

## Basis of the advice

**Table 4** Witch in Subarea 4 and divisions 3.a and 7.d. The basis of the advice.

Advice basis	Precautionary approach.
Management plan	The EU multiannual plan (MAP) for stocks in the North Sea (EU, 2018) and adjacent waters applies to bycatches of this stock.
	The EC has requested that ICES provide advice based on the precautionary approach.

## Quality of the assessment

Witch was benchmarked in 2018 (ICES, 2018a), changing the perception of stock status and trends compared with previous advice.

Witch are generally distributed in deeper areas, and the IBTS survey does not cover some of that habitat. A fisheries-independent survey that has both adequate catchability of large flatfish and covers the entire distribution area of the stock, would improve the assessment.

Age information is only available from 2009 onwards, increasing the uncertainty prior to 2009 in the assessment.

## Issues relevant for the advice

This is the first time ICES provides advice for witch as a category 1 stock.

The basis for the advice this year is the precautionary approach, as requested by the European Commission.

The precautionary advice for this stock is based on a constant fishing mortality that has a low probability of bringing SSB below  $B_{lim}$  in the long term ( $F_{P.05} = 0.20$ ; see ICES, 2018b). This would imply a decrease in  $F$  compared to current levels (0.24), but still above  $F_{MSY}$  (0.154).

Witch is mainly a bycatch species in mixed fisheries. Witch and lemon sole are largely caught by different fisheries in different areas. Management of lemon sole and witch under a combined species TAC may hinder effective management of the single-species exploitation rates and could potentially lead to the overexploitation of witch. A single-species TAC for witch, covering the entire stock, would be more appropriate.

## Reference points

**Table 5** Witch in Subarea 4 and divisions 3.a and 7.d. Reference points, values, and their technical basis. All weights are in tonnes.

Framework	Reference point	Value	Technical basis	Source
MSY approach	MSY $B_{trigger}$	4 745	Set equal to $B_{pa}$ .	ICES (2018a)
	$F_{MSY}$	0.154	EQsim simulation of long-term yield.	ICES (2018a)
Precautionary approach	$B_{lim}$	3 069	Breakpoint in a segmented regression, based on recruitment 1940–2016.	ICES (2018a)
	$B_{pa}$	4 745	$B_{lim} \times \exp(1.645 \times \sigma)$ , where $\sigma = 0.265$ is the standard deviation of the $\ln(SSB(2017))$ .	ICES (2018a)
	$F_{lim}$	0.30	Simulation using $B_{lim}$ and $B_{pa}$ with no assessment and advice noise.	ICES (2018a)
	$F_{pa}$	0.20	$F_{P.05}$ without ICES advice rule.	ICES (2019)

**Basis of the assessment**

**Table 6** Witch in Subarea 4 and divisions 3.a and 7.d. Basis of the assessment and advice.

ICES stock data category	1 (ICES, 2018b).
Assessment type	Age-based analytical assessment (SAM; ICES, 2018a).
Input data	In order to obtain convergence, artificial catch-at-age data were added to the beginning of the time-series (1940–1944), leaving a period of five years without data before the total landings series started in 1950. Commercial catches (international landings and ages from catch sampling by métier raised in Intercatch). Three survey indices (IBTS Q1 from 1983, IBTS Q3 from 1991, BTS Q1 from 1991); age-based from 2009–2018, total biomass until 2008. Assumed constant natural mortality (over ages and years) and maturity ogive (over years).
Discards and bycatch	Discards were quantified for the years 2002–2018. Discards ranged between 9.5% and 23.3% of the total catches. The discard coverage in 2018 was 91%.
Additional indicators	None.
Other information	Benchmarked in 2018 (ICES, 2018a).
Working group	Working Group on the Assessment of Demersal Stocks in the North Sea and Skagerrak (WGNESSK)

**Information from stakeholders**

There is no additional available information for this stock.
