

ECOREGION **Widely distributed and migratory stocks**
STOCK **Greater forkbeard (*Phycis blennoides*) in the Northeast Atlantic**

Advice for 2011

Fishery should not be allowed to expand, and a reduction in catches should be considered, in light of survey data indicating a recent decline.

Stock status

Fishing mortality	2007	2008	2009
F_{MSY}	Unknown	Unknown	Unknown
F_{PA}/F_{lim}	Unknown	Unknown	Unknown
Spawning Stock Biomass (SSB)	2008	2009	2010
MSY B_{trigger}	Unknown	Unknown	Unknown
B_{PA/B_{lim}}	Unknown	Unknown	Unknown

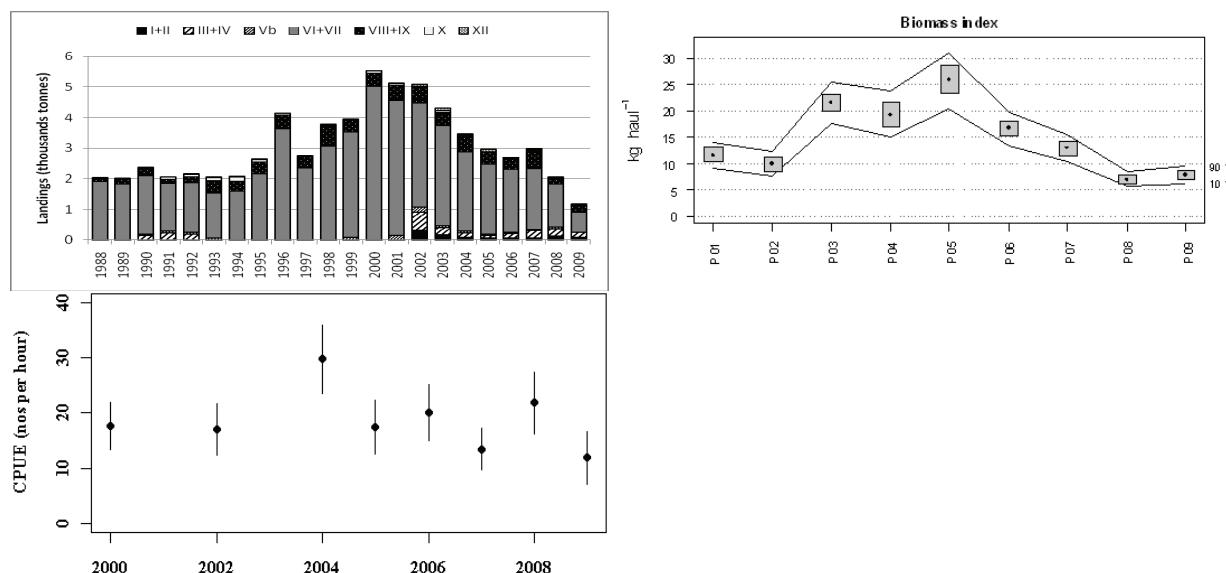

Figure 9.4.17.1 Greater forkbeard in the Northeast Atlantic. Top left: Landings by Subarea. Top right: Biomass indices from Spanish Porcupine survey (2001-2009). Boxes mark parametric standard error of the stratified abundance index. Lines mark bootstrap confidence intervals ($\alpha = 0.80$, bootstrap iterations = 1000). Bottom: Cpue (n°/hour) from the Scottish IBTS survey in Division VIa since 2000.

The biomass index for Division VIa has fluctuated without any consistent trend since 2000 however the Spanish survey on Porcupine Bank indicates a decline from 2005 onwards. It is unclear whether the current level of exploitation is having a detrimental effect on the stock. The time series are short and recent levels are not known relative to historic values.

Management plans

No specific management objectives are known to ICES.

According to the EU policy paper on fisheries management (17 May 2010, [COM\(2010\) 241](#)) this stock is classified under category 11.

The fisheries

The landings of greater forkbeard are mainly bycatch from demersal trawl and longline fisheries targeting species such as hake, megrim, monkfish, ling, and blue ling. Considering the mixed-fishery characteristic of greater forkbeard fisheries, this species should not be managed in a single-species context and any advice should take into account advice on other species/fisheries.

Since 1988, around 80% of landings came from Subareas VI and VII, and (12%), from Subareas VIII and IX (mainly from VIII). Fluctuations in landings may not necessarily be linked with changes in forkbeard abundance.

Effects of the fisheries on the ecosystem

Deepwater trawls impact ocean floor, which includes potential damage to deepwater coral communities. As this fishery is part of mixed fisheries, any effort on greater forkbeard also impacts other commercial and non commercial deepwater species.

Quality considerations

In some Subareas landings do not make a clear distinction between the species *Phycis blennoides*, *Phycis phycis*, and *Phycis* spp., and also with Morids in landings.

Scientific basis

Assessment type	Survey trends based assessment
Input data	3 surveys (Spanish Porcupine survey; Scottish IBTS survey; EVOHE-IBTS)
Discards and bycatch	-
Indicators	-
Other information	This stock was benchmarked in 2010 (WKDEEP 2010)
Working group report	WGDEEP

ECOREGION STOCK **Widely distributed and migratory stocks
Greater forkbeard (*Phycis blennoides*) in Northeast Atlantic****Reference points**

No reference points have been set for this stock.

Outlook for 2011

No reliable assessment can be presented for this stock and fishing possibilities cannot be projected.

The 2008-2009 data (landings, surveys and cpue) give no reason to change the advice from that given in 2008: “*Fisheries on greater forkbeard should be accompanied by programmes to collect data. The fishery should not be allowed to expand unless it can be shown that it is sustainable*”, and a reduction in catches should be considered, in light of survey data indicating a recent decline.

Additional considerations

Since 1988, around 80% of the total landings of forkbeard in ICES area came from Subareas VI and VII. Since 2001 landings from Subareas I, II, III and IV increased considerably. In the case of Subareas I and II the increase of the landings is dependent on market prices.

In 2008 and 2009, landings in Subareas VIII and IX were reduced due to the decrease of Spanish landings. The Spanish landings in these Subareas come historically from trawler and longline fleet (63% and 32%, respectively).

There are difficulties in the species-specific identification of landings in some Subareas. Landing data could include significant landings of *Phycis* spp, *Urophycis* spp species.

Assessment and management area

ICES considered greater forkbeard as a single stock unit for all the Northeast Atlantic. Management units are divided into four subgroups under EU TAC Regulation: i) Subareas I, II, III, IV; ii) Subareas V, VI, VII; iii) Subareas VIII, IX; and iv) Subareas X, XII.
