

### 3.13.4

### Tusk (*Brosme brosme*)

**State of the stock/exploitation:** The state of the stock is highly uncertain due to the lack of relevant CPUE data for the major fisheries in the most recent years. Previously presented mortality estimates from several areas for the last decade were high. The fleet and the catches have increased and the fishing areas and practices are the same, therefore it is unlikely that the exploitation rate has decreased in recent years. The stock may therefore remain outside safe biological limits. In 2000, it was concluded that the exploitable stock biomass would appear to be less than 20% of virgin biomass and fishing mortality was relatively high. CPUE series from the fishery and groundfish survey in Division Va presented in 2002 suggests a pronounced decline in recent years also in that area (Figures 3.13.4.1–2).

**Advice on management: ICES recommends that the overall fishing effort be reduced by 30%.**

**Relevant factors to be considered in management:** Tusk is more vulnerable to over-exploitation than ling, due to a slower growth rate and high age at maturity. Most of the tusk landings are by-catch in ling fisheries and therefore the reductions recommended for that species should facilitate the advised reductions for tusk.

Landings are mainly by-catches in longline fisheries directed at ling and blue ling in Divisions IIa, Va, Vb and VIa. In Division Vb tusk is also taken as a by-catch in trawl fisheries.

**Comparison with previous assessment and advice:** No comparison of assessments was possible. In Division Va, the survey index from the Icelandic groundfish survey suggests a pronounced declining abundance.

**Elaboration and special comment:** Landings by Subarea/Division and nation are given in Table 3.13.4.1.

Ling (*Molva molva*) and tusk (*Brosme brosme*) are not generally regarded as “true” deep-water fish species although they are found in waters on the upper continental slope between the depths of ca. 200 m-600 m. However, this depth range has some species, including ling and tusk, that are also found in waters less than 200 m deep on the outer continental shelf. Other commercial fish species caught in this depth range that are also found commonly in shallower shelf-sea waters include anglerfish (*Lophius spp.*) and megrim (*Lepidorhombus spp.*).

For the quota-year starting 1 September 2001 and ending 31 August 2002 the agreed national TAC by Iceland is 4 500 t in Division Va.

**Source of information:** Report of the Working Group on the Biology and Assessment of Deep-Sea Fisheries Resources, 4–10 April 2002 (ICES CM 2002/ACFM:16).
