DEMERSAL FISH COMMITTEE
by $\begin{gathered}\text { bughn C. Anthony }\end{gathered}$

1987

BELGIUM
(R. De Clerck)

Recording of densities and growth rates of the 1986 and 1987 year-classes of sole, plaice, dab, flounder, cod and whiting was carried out.

Two cruises were also undertaken for the international demersal young fish survey.

The groundfish survey continued in order to estimate the stock size of adult flatfishes in the Southern North Sea by means of a beamtrawl fishery in August. This was part of an international survey.

The market sampling was continued covering cod-North Sea, whiting-North Sea, haddock-North Sea, plaice and sole-North-Sea-English Channel-Celtic Sea and Irish Sea (see table).

CANADA
(R. Wells)

Canada had no fisheries and no research activity in the ICES area in 1987. Activities in the Northwest Atlantic in 1987 have been reported to NAFO.

No work was carried out on demersal fish other than that reported to the Baltic Fish Comittee.

## FEDERAL REPUBLIC OF GERMANY

(G. Rauck)

The biological sampling programme of demersal species on board research vessels, commercial trawlers and on fish markets has been continued.

This sampling scheme, including length frequency measurements, otolith samplings, single weights of fish, tagging of fish, stomach sampling, as well as studies on fish density and distribution of demersal fish species were carried out during ground fish surveys.

The monthly bycatch analysis of the shrimp fishery as well as the joint investigations in the Wadden Sea area of Niedersachsen and Schleswig-Holstein (young fish and brown shrimp survey) have been continued in spring and autumn together with vessels from the Netherlands and Belgium.

Investigations on cod discards in the commercial fisheries and cod selectivity studies using mesh sizes of 90 and 100 mm mesh openings were carried out in the German Bight.

The cod sampling scheme off Greenland has been continued aiming at a stock separation by means of different otolith strucutures.

A North Sea groundfish survey with special emphasis on the gadoid and pelagic species covering the area $I V a$ and $b$ has been repeated.

Research vessel cruises related to the national sampling scheme of the demersal species were as follows:

## ICELAND

(J. Magnusson)

In general the research work and the biological sampling programme on demersal fish was carried out along the same lines as in previous years and the research thus based both on research vessel data and market sampling.

The greatest part of the research vessels data was collected during the annual groundfish survey which is carried out simultaniously with five commercial stern trawlers of same type covering some 600 stations.

Two research cruises were directed towords deep sea species, in particular blue ling grenadier and silver smelt.

The witch became a subject for aimed fishery and a sampling programme on that fishery was implemented.

Market sampling was carried out from the main office of the Marine Research Institut in Reykjavik and from the five branches of MRI.

Fishery inspectors collected also a considerable amount of data on demersal fish on board commercial fishing vessels and at the market.

The number of sampled demersal fish is shown in the attached tables.

Witch

## NETHERLÄNDS

## (F.A. van Beek)

In 1987 the market sampling of landings of the Dutch fleet in The Netherlands was continued for the following species: brill (Scophthalmus rhombus), cod (Gadus morhua), haddock (Melanogrammus aeglefinus), plaice (Pleuronectes platessa), sole (Solea solea), turbot (Scophthalmus maximus) and whiting (Merlangius merlangus). For roundfish the market sampling was stratified on an area basis. For the other species samles were stratified by harbour. All samples were also stratified by market catogery. The tables below indicate the level of sampling.

In addition samples of flounder (Platichthys flesus) and dab (Limanda limanda) were obtained for otolith studies.

In the period January-March R.V. "Tridens" (4 weeks), R.V. "Isis" ( 5 weeks) and a charter vessel ( 2 weeks) carried out egg-surveys on cod and plaice in the North Sea. These surveys will be continued in 1988. The aim of these surveys is to estimate the egg production and stock of these species in this area.

In February R.V. "Tridens" (4 weeks) and R.V. "Isis" (3 weeks) participated in the International Young Fish Survey (IYFS). These surveys, carried out since 1965, estimate the relative abundance of 1 and 2 year old herring and roundfish.

In May the distribution of 0 -group cod was investigated in the southern North Sea with R.V. "Tridens" ( 2 weeks). The larvae were probably too small by then for the gear used (GOV trawl with small meshed cod-end) and only a few specimens were collected.

In summer three coastal surveys directed on juvenile brown shrimps (Crangon crangon) and 0-group sole were carried out with R.V. "Isis" ( 3 weeks) in order to investigate the settlement of these species in the beach zone.

In August a survey was carried out on R.V. "Tridens" (3 weeks) and R.V. "Isis" (2 weeks) in the southern and central North Sea with the standard GOV trawl in the framework of the ICES multispecies program.

In August a beam trawl survey was carried out by R.V. Isis (4 weeks) in the southern North Sea in collaboration with Belgium in order to investigate the abundance and distribution of adult plaice and sole in these areas. A similar survey on a reduced station grid was carried out by R.V. "Tridens" in April in combination with the DYFS survey.

In September-October R.V. "Tridens" ( 3 weeks), R.V. "Isis" (4 weeks), R.V. "Stern" ( 4 weeks) and R.V. "Schollevaar" ( 2 weeks) participated in the Demersal Young Fish Surveys (DYFS). These surveys estimate relative abundance of brown shrip and juvenile plaice and sole in the continental nursery areas. The surveys are carried out since 1969 in collaboration with Belgium and the Federal Republic of Germany. In April a DYFS survey was carried out on a reduced station grid by R.V. "Tridens" (4 weeks) and R.V. "Schollevaar" (2 weeks).

On board of R.V. "Isis" 2042 young soles (range $15-24 \mathrm{~cm}$ ) were tagged in the German Bight near I Heligoland with the Peterson mini tag in October ( 2 weeks). In the
same period also 700 young plaice were tagged north of Terschelling. Also for plaice the Peterson mini tag was used. Besides they were injected with tetra-cycline.
In October-November R.V. "Tridens" (3 weeks) and R.V. "Isis" (3 weeks) carried out a survey in the southern North Sea with the GOV trawl directed to roundfish. This survey is held since 1980 (Dutch Groundfish Survey).

## NORWAY

(T. Jakobsen)

## Sub-areas I and II

The research activities at sea were slightly reduced compared to 1986 because of reduced funds for hiring comecial vessels. The research vessels, however, carried out the same programme as in 1986. The distribution and abundance of young cod and haddock and of redfishes in the Barents Sea were investigated during a combined acoustic and stratified bottom trawl survey in January - March. The distribution and abundance of spawning cod was investigated during an acoustic survey of the Lofoten area in March. Combined with shrimp investigations, the distribution of young cod and haddock was studied in the central Barents Sea in April - May and in the Svalbard area in July - August. The distribution and abundance of cod, haddock, redfishes, catfishes, and Greenland halibut were investigated in the Svalbard area in September - October. Part of this survey was included in a multi-species acoustic survey carried out during the same period, when the distribution and abundance of cod, haddock and redfishes were investigated also in the Barents Sea.

Investigations on distribution and drift of cod eggs were carried out in February and investigations on cod larvae and post-larvae were carried out in April - July. In August - September the annual international o-group survey, aimed primarily at cod, was carried out in the Barents Sea and adjacent waters.

Investigations on distribution and drift of haddock eggs were carried out in April-May, and the distribution of 0 -group haddock was charted in August - September during the international o-group survey.

Investigations on distribution and drift of saithe eggs were carried out in February - March. An o-group (post-larvae) survey for saithe in the area from Stad ( $62^{\circ} \mathrm{N}$ ) to north of Lofoten ( $69^{\circ} \mathrm{N}$ ) was carried out in May, and an agoustic survey for saithe on the coastal banks from North Cape to 62 N was carried out in October-November.

The distribution of silver saelt was studied on the coastal banks during a survey in March - April.

The sampling programme for commercial catches of cod, haddock, and saithe was continued. Samples of redfish and Greenland halibut were also taken.

## Sub-area IV

The distribution and abundance of I- and II-group gadoids were studied in February as part of the International Young Fish Survey. In April an investigation on post-larvae of saithe was undertaken in Norwegian waters, while the distribution and abundance of 0 -group of other gadoids were studied in July in the northern North Sea. In February and July, the distribution and abundance of saithe were investigated during acoustic surveys in the northern North Sea. The distribution and abundance of sandeel in the Norwegian economic zone were investigated during an acoustic survey in May. The sampling of commercial catches of sandeel, Norway pout, and saithe was continued.

## pQRTUGAL <br> (Fátima Cardador)

During 1987 the National Institute of Fisheries Research (INIP) has continued with the National Sampling Programme at the main fishing ports concerning length frequency distribution of the landings for the most important species.

The Portuguese Institute (INIP) had also conducted some groundfish surveys mainly to estimate distribution and indices of abundance and recruitment of the most commercial species.

The following tables present the sampling data collected for hake (Merluccius merluccius),black-scabbard (Apbanopus carbs), some species of seabreams (Boops boops, Pagellus acarne and Spondyliosoma cantharus) and monkfish (Lophius budegassa and L. piscatorius)

## SWEDEN

## (B. Sjöstrand)

Sweden took part in the International Young Herring Survey in the North Sea and Skagerrak. It has no other activities on which to report.

## UNITED KINGDOM (England and Wales)

```
(W. G. Parnell & C. T. Macer)
```

The market sampling programme was continued in 1987. The number of fish measured and aged from the market samples is shown in the tables.

The following research cruises took place in 1987.
In January a collection of Stage IV female plaice gonads from the Hinder grounds was made on CLIONE for a study of year-by-year fecundity variation. In February CIROLANA participated in the International Young Fish Survey. Studies on the migration of plaice moving to and from their spawning grounds in the eastern Channel in relation to the larvae cycle were carried out on CLIONE in March. In the same month, CIROLANA made a trawl survey of the western English Channel, Celtic Sea and Bay of Biscay as part of a continuing programme of stock monitoring in the area, and a charter vessel carried out a groundfish survey along the Welsh coast.

In April a charter vessel carried out a 2 -metre beam trawl survey along the East Anglian coast to estimate the post-winter population of juvenile sole. Charter vessels were used to carry out a pre-recruit bass survey in the Solent and Southampton Water in May, a groundfish survey off the Welsh coast in June, and 2 m beam trawl surveys to sample juvenile fish and identify sole nursery grounds in the Irish Sea between July and October.

CLIONE carried out a trawl survey of plaice and sole in ICES areas VIId and the western edge of IVc in August while CIROLANA made the IIth English Groundfish survey in the North Sea in August/September.

[^0]A young demersal fish survey using 2 m beam trawls and push nets was carried out along the English east and south coasts between the Wash and Swanage in September. A double beam trawler was chartered to carry out a survey for sole in the western Channel, and a pre-recruit bass survey was undertaken in the Solent and Southampton Water also in September. In the western English Channel, Celtic Sea and Cardigan Bay in October/November, plaice ovaries were collected and sole samples taken on CIROLANA.

CIROLANA carried out a trawl survey of the western Celtic Sea in November/ December. A study of the migration of plaice moving to and from their spawning grounds in the eastern English Channel in relation to maturity stage, day/ night and tide took place on CLIONE in December. A charter to estimate the population of o-group/juvenile bass was carried out in the River Medway also in December.

# UNITED KINGDOM <br> (Scotland) <br> (R. Jones) 

## 1. Sampling Demersal Fish

Continuous monitoring was maintained on the catches caught by the five main gears (motor trawl, seine net, light trawl, Nephrops trawl and demersal pair trawl) used by Scottish fishermen. Landings were sampled at all the major fishing ports in Scotland and the intensity of sampling is indicated in the text table below.

| Species | No of vessels <br> sampled | No of fish <br> measured | No of otoliths <br> collected |
| :--- | :--- | :---: | :---: |
| Cod | 391 | 60167 | 14236 |
| Haddock | 401 | 141899 | 17310 |
| Whiting | 355 | 84172 | 9543 |
| Saithe | 245 | 14748 | 7310 |

Sampling of demersal fish discarded by the Scottish fleet was also carried out on a regular basis in 1987. Samples were obtained during the course of commercial trips from hauls. The intensity of sampling is indicated in the text table below.

| Species | No of vessels sampled | No of fish measured | No of otoliths collected |
| :---: | :---: | :---: | :---: |
| Cod | 56 | 8557 | 1408 |
| Haddock | 56 | 65064 | 3273 |
| Whiting | 56 | 44269 | 3258 |
| Saithe Others | 56 | 59869 | - |

## 2. Research Vessel Activities

In February 1987 "Scotia" participated in the International Young Fish Survey in the North Sea.

In March 1987 "Scotia" carried out a survey of demersal fish and herring stocks off the west coast of Scotland (ICES Sub area VIa).

In August 1987 "Scotia" carried out a survey of demersal fish stocks in the northern and middle North Sea (ICES Sub area IVa and IVb).

In June 1987 "Clupea" carried out a pelagic 0-group survey for gadoid species in the northern North Sea (ICES Sub area IVa).

In August 1987 a commercial vessel, the "Dawn Sky", was chartered to carry out a survey of the haddock stock on Rockall Bank.

## 3. Tagging of Demersal Fish

During August 1987, 352 saithe were tagged at an inshore site close to Aberdeen.
U.S.A.
(V. Anthony \& B. Rothschild)

The U.S.A. had no fisheries and no research activity in the ICES area in 1987. Activities in the Northwest Atlantic in 1987 have been reported to NAFO.

## U.S.S.R.

(S. A. Studenetsky)

In 1987, as previously, a total trawl-acoustic survey was carried out to assess abundance and biomass of main commercial fishes, recruitment to cod, haddock, redfish and other fish stocks was evaluated during ichthyoplankton and young fish surveys in the Barents Sea and adjacent waters.

Investigations were continued to determine relationships between distribution of fish, their behaviour and hydrological conditions, food supply. Stock structure of major commercial fishes, their biological characteristics and migration patterns were studied.

Tables 1-8 present information collected during 1987.
