Report of Activities
demersal fish committee
by

Vaughn C. Anthony

1988

## BELGIUM

(R. De Clerck)

Recording of densities and growth rates of the 1987 and 1988 year classes of sole, plaice, dab, flounder, cod and whiting was carried out. Two cruises were therefore undertaken according to the criteria of the International Demersal Young Fish Survey. The groundfish survey was continued in order to estimate the stock size of adult flatfish in the southern North Sea by means of a beamtrawl fishery in August. This was part of an international survey in collaboration with the Dutch Institute.

The market sampling was continued covering cod (North Sea), whiting (North Sea), haddock (North Sea), plaice and sole (North Sea-English Channel-Celtic Sea and Irish Sea. (see following tables).

| Area | Season | No. of samples |  | No. of fish |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Res. Vessels | Market | measured | aged |

## SANDEEL

Sampling

## WHITING

## Sampling

## EAROES

(J. Reinert)

The sampling programme for commercial catches of saithe, cod and haddock was continued in 1988. Samples of tusk and redfish were also taken; se table for more details.

## The following research cruises took place in 1988.

In January-February r/v Magnus Heinason carried out a trawl survey in deeper waters around the Faroes, especially for redfish, blue ling and saithe.

In February-March r/v Magnus Heinason continued the Faroese Groundfish Surveys to get information on the stock sizes of saithe, cod and haddock; see table for more details.

In April r/v Magnus Heinason carried out a trawl survey for pelagic beaked redfish in the Irminger Sea especially to investigate relationship with beaked redfish from other areas.

In April-May and August a commercial vesset, Verona, was chartered to carry out surveys at the Faroes with gill nets for flatfishes.

In May r/v Magnus Heinason carried out a combined acoustic and trawl survey to get information on the distribution of silver smelt in Faroese waters.

In May-July a commercial longliner, Hans Erik, was chartered to carry out a survey with long line in deeper waters around the Faroes and in the Hatton Bank area; the target species were grenadier, black scabbard fish and sharks.

In June r/v Magnus Heinason continued the O-Group Surveys in Faroese Waters to get information on the year-class strength of cod, haddock, norway pout and sandeel.

In June-July r/v Magnus Heinason carried out a trawl survey in deeper waters around the Faroes for blue ling, grenadier and black scabbard fish.

In June and August a commercial vessel, figir, was chartered to carry on selection studies in the Faroese summer fishery with bottom trawl inside the 12 nautical mile zone; the method was alternate hauls with 40,100 and 135 mm mesh sizes in the codend.

In September-October selection studies on saithe, cod and haddock were carried out with r/v Magnus Heinason using alternate hauls with 40,135 and 155 mm mesh sizes in the codend.

In October-November r/v Magnus Heinason carried out a combined acoustic and trawl survey around the Faroes as a part of a sampling programme to get more information on the population dynamics etc. on redfish ( $S$. marinus, $S$. mentella and $S$. viviparus); in addition, selection studies for redfish were carried out using alternate hauls with 40,135 and 155 mm mesh sizes in the codend.

In November-December r/v Magnus Heinason carried out a trawl survey in deeper waters around the Faroes for saithe and redfish.

On all cruises with r/v Magnus Heinason biological samples are taken as a routine for most fish species from almost every haul and the measurements are entered into the vessel computer automatically. As all data have not been edited yet, the number of samples and measurements by species for the year 1988 can not be given at this point except for the Faroese Groundfish Surveys.

## FINLAND

(V. Sjöblom \& E. Aro)

No work was carried out on demersal fish other than that reported to the Baltic Fish Committee.

## FRANCE

No report received.

## FEDERAL REPUBLIC OF GERMANY

## (C. Rauck)

The biological sampling programme of demersal species on board research vessels, commercial trawlers and on fish markets has been continued.

This sampling scheme, including length frequency measurements, otolith samplings, single weights of fish, tagging of fish, stomach sampling, as well as studies on fish density and distribution of demersal fish species were carried out during ground fish surveys.

The monthly bycatch analysis of the shrimp fishery as well as the joint investigations in the Wadden Sea area of Niedersachsen and Schleswig-Holstein (young fish and brown shrimp survey) have been continued in spring and autumn together with vessels from the Netherlands and Belgium.

Investigations on cod discards in the commercial fisheries and cod selectivity studies using different mesh openings were carried out in the German Bight.

A North Sea groundfish survey with special emphasis on the gadoid and pelagic species covering the area IVa and $b$ has been repeated.

Research vessel cruises related to the national sampling scheme of the demersal species were as follows:
R. V. "Walther Herwig"

| Months | ICES area | Objectives |
| :--- | :--- | :--- |
| January | IVb | Groundfish survey (fish disease) |

## IRELAND

( $R$ Grainger)
Port sampling of commercial catches of cod, haddock and whiting in Divisions VIa and VIIb and of haddock from Division VIb was undertaken, as in previous years. Landings of cod, whiting and plaice from Division VIIa and discards of whiting from the VIIa Nephrops fishery also continued to be sampled. In addittion, sampling of hake, megrim and angler (L. piscatorius and $L$. budegassa) in Division VIa and Sub-area VII (except VIIa) was carried out. Sole was sampled from catches of beam trawlers fishing in Division VIIa for the first time.

A beam trawl survey for juvenile plaice in shallow water off the east coast of Ireland was carried out as usual in May.

Groundfish surveys in the Irish Sea in June and September aimed at pre-recruit whiting and cod were conducted as they have been since 1984.

## The Netherlands

(F.A. van Beek)

In 1988 the market sampling of landings of the Dutch fleet from the North Sea in The Netherlands was continued for the following species: brill (Scophthalmus rhombus), cod (Gadus morhua), hiddock (Melanogrammus aeglefinus), plaice (Pleuronectes platessa), sole (Solea solea), turbot (Scophthalmus maximus) and whiting (Merlangius merlangus). For roundfish the market sampling was stratified on an area basis. For the other species samples were stratified by harbour. All samples were also stratified by market category. The tables below indicate the level of sampling.

In January a survey was carried out with the R.V. "Isis" ( 1 week) using a 8 m . beam trawl in order to test a panel in the front of the net which is used in some areas during the Beam Trawl Survey (BTS).

In February R.V. "Tridens" (4 weeks) participated in the International Young Fish Survey (IYFS). These surveys, carried out since 1965, estimate the relative abundance of 1 and 2 year old herring and roundfish.

In the period January-March R.V. "Tridens" (4 weeks), R.V. "Isis" ( 6 weeks) and a chartered vessel (2 weeks) carried out egg-surveys on cod and plaice in the North Sea. The aim of these surveys is to estimate the egg production and stock size of these species in this area.

A combined egg survey in the second quarter on sole, mackerel and horse mackerel was carried out by R.V. "Tridens" ( 6 weeks), R.V. "Isis" ( 4 weeks) and a chartered vessel ( 2 weeks). in the southern North Sea.

In June 3002 flounders (Platichthys flesus) and 1975 dab (Limanda limanda) were tagged along the Dutch coast and in the Scheldt Estuary by R.V. "Isis" (2 weeks)

On board of R.V. "Isis" 2564 young plaice (range $15-24 \mathrm{~cm}$ ) were tagged along the Danish coast with the Peterson mini tag in July ( 2 weeks). Part of the tagged fish were injected with tetra-cycline.

In August a survey was carried out on R.V. "Tridens" (1 week) in the southern and central North Sea with the standard GOV trawl in the framework of the ICES multispecies program.

In September-October R.V. "Tridens" (3 weeks), R.V. "Isis" (4 weeks), R.V. "Stern" ( 4 weeks) and R.V. "Schollevaar" ( 2 weeks) participated in the Demersal Young Fish Surveys (DYFS). These surveys estimate the relative abundance of brown shrimp and juvenile plaice and sole in the continental nursery areas. The surveys are carried out since 1969 in collaboration with Belgium and the Federal Republic of Germany. In

April a DYFS survey was carried out on a reduced station grid by R.V. "Tridens" (4 weeks).

In August a Beam Trawl Survey (BTS) was carried out by R.V. "Isis" ( 5 weeks) in the southern North Sea in collaboration with Belgium in order to investigate the abundance and distribution of adult plaice and sole in these areas. A similar survey on a reduced station grid was carried out by R.V. "Tridens" in April in combination with the DYFS survey.

In October-November R.V. "Tridens" (3 weeks) and R.V. "Isis" (3 weeks) carried out a survey in the southern North Sea with the GOV trawl directed to roundfish. This survey is held since 1980 (Dutch Groundfish Survey).

## NORWAY

(T. Jakobsen, O. Smedstad)

Sub-areas I and II
The research activities at sea were slightly increased compared to 1987. The research vessels, however, carried out virtually the same programme as in 1987. The distribution and abundance of young cod and haddock and of redfishes in the Barents Sea were investigated during a combined acoustic and stratified bottom trawl survey in January March. The distribution and abundance of spawning cod was investigated during an acoustic survey of the Lofoten area in March. Combined with shrimp investigations, the distribution of young cod and haddock was studied in the central Barents Sea in April - May and in the Svalbard area in July - August. The distribution and abundance of cod, haddock, redfishes, catfishes, and Greenland halibut were investigated in the Svalbard area in September - October. Part of this survey was included In a multi-species acoustic survey carried out during the same period, when the distribution and abundance of cod, haddock and redfishes were investigated also in the Barents Sea.

Cod were tagged in the Lofoten area in March and haddock off northeastern Norway in June.

The spawning progress of cod and haddock in the Lofoten area was monitored by sampling of eggs and larvae from February to May. Investigations on cod larvae and post-larvae were carried out in June and July. In August $=$ September the annual international 0-group survey, aimed primarily at cod, was carried out in the Barents Sea and adjacent waters.

Investigations on distribution and drift of haddock eggs were carried out in April - May, and the distribution of $0-$ group haddock was charted in August - September during the international 0-group survey.

Investigations on distribution and drift of saithe eggs were carried out in February - April. An 0-group (post-larvae) survey for saithe in the area from Stad $\left(62^{\circ} \mathrm{N}\right)$ to north of Lofoten $\left(69^{\circ} \mathrm{N}\right)$ was carried out in May, and an acoustic survey for saithe on the coastal banks from North Cape to $62^{\circ} \mathrm{N}$ was carried out in November-December.

The distribution of silver smelt was studied on the coastal banks during a survey in April - May.

The sampling programe for commercial catches of cod, haddock, saithe. redfish and Greenland halibut was continued.

Sub-area IV
The distribution and abundance of I- and II-group gadoids were studied in February as part of the International Young Fish Survey. In April an investigation on post-larvae of saithe was undertaken in Norwegian waters. In February, the distribution and abundance of saithe were investigated during acoustic surveys in the northern North Sea. The distribution and abundance of sandeel in the Norwegian economic zone were investigated during an acoustic survey in April. The sampling of commercial catches of sandeel. Norway pout, and saithe was continued.

POLAND
(J. Janusz \& M. Liwoch)

No biological samples were collected in the NE Atlantic area by Poland.

PORTUGAL<br>(Fatima Cardador)

#### Abstract

In 1988 the market sampling of the Instituto Nacional de Investigasão das Pescas (INIP) was continued at some fishing ports to provide lenght frequency distributions of the landings for the most important commercial species.

The INIP carried out a groundfish survey in October/November in the portuguese waters mainly to estimate distribution and indices of abundance and recruitment of hake and horse mackerel, on board of the R/V "Noruega". Some other groundfish surveys were also conducted to estimate the distribution and to develop biological studies of hake and monkfish.

The following tables present the sampling data collected for hake (Merluccius merluccius), black-scabbard fish (Aphanopus carbo), some species of seabreams (Boops boops, Pagellus acarne and Spondyliosoma cantharus) and monkfish (Lophius budegassa and $L$. piscatorius).

1. Sampling data for Merluceius merluccius

## 5.Sampling data for Spondyliosoma cantharus

6. Sampling data for Monkfish (Lophius piseatorius and L. budegassa)

* surveys directed to shrimp and Norway lobster.

During 1988 the Spanish Institute of Oceanography has continued with the sampling programme at the main fishing ports concerning length frequency distribution of the landings for the most important species.

Groundfish surveys have been conducted mainly to estimate indices of abundance, recruitment and selectivity factors of the commercial species.

The following tables present the sampling data collected.

## SWEDEN

(B. Sjöstrand)

Sweden took part in the International Young Herring Survey in the North Sea and Skagerrak. It had no other activities on which to report.

UNITEDKINGDOM (England and Wales)
(C.T. Macer)

The market sampling programme was continued in 1988. The numbers of fish measured and otolithed are shown in the following tables.

The following research vessel cruises took place in 1988:
RV "Cirolana" participated in the North Sea International Young Fish Survey in February. Groundfish surveys were conducted in the North Sea in August/September, and in the Celtic Sea in March and November/December.

Plaice fecundity was investigated from RV "Corystes" in January/February in the southern North Sea and plaice telemetry trials took place in April/MaY. Sole spawning in the Bristol Channel was the cruise aim in April, while in the eastern Channel in August a groundfish survey for plaice and sole took place using a beam trawl. A survey for young fish was completed in the Irish Sea/Bristol Channel in September/October, and a cruise in October/November was devoted to a study of gastric evacuation and also the incidence of fish diseases.

## UNITED KINGDOM (Scotland)

## (R. Jones)

## 1. Sampling Demersal Fish

Continuous monitoring was maintained on the catches caught by the five main gears (motor trawl, seine net, light trawl, Nephrops trawl and demersal pair trawl) used by Scottish fishermen. Landings were sampled at all the major fishing ports in Scotland and the intensity of sampling is indicated in the text table below.

| Species | No of vessels <br> sampled | No of fish measured | No of otoliths <br> collected |
| :--- | :---: | :---: | :---: |
| Cod | 422 |  |  |
| Haddock | 447 | 72353 | 15365 |
| Whiting | 378 | 158764 | 19296 |
| Saithe | 286 | 89625 | 10161 |
|  |  | 17216 | 6533 |

Sampling of demersal fish discarded by the Scottish fleet was also carried out on a regular basis in 1988. Samples were obtained during the course of commercial trips from hauls. The intensity of sampling is indicated in the text table below.

| Species | No of vessels <br> sampled | No of fish measured | No of otoliths <br> collected |
| :--- | :---: | :---: | :---: |
| Cod | 68 | 4057 | 1226 |
| Haddock | 68 | 74737 | 4319 |
| Whiting | 68 | 56637 | 4616 |
| Saithe | 68 | 535 | 380 |
| Others | 68 | 90541 | - |

## 2. Research Vessel Activities

In February 1988 "Scotia" participated in the International Young Fish Survey in the North Sea.
In March 1988 "Scotia" carried out a survey of demersal fish and herring stocks off the west coast of Scotland (ICES Sub area VIa).

In August 1988 "Scotia" carried out a survey of demersal fish stocks in the northern and middle North Sea (ICES Sub area IVa and IVb).

In September 1988 "Scotia" carried out a survey of the haddock stock on Rockall Bank.
In June 1988 "Clupea" carried out a pelagic 0 -group survey for gadoid species in the northern North Sea (ICES Sub area IVa).

## 3. Tagging of Demersal Fish

During August-September 1988, 150 saithe were tagged at an inshore site close to Aberdeen.

```
    U.S.A.
    (V. Anthony and B. Rothschild)
```

The U.S.A. had no fisheries and no research activity on demersal fish in the ICES area in 1988. Activities in the Northwest Atlantic have been reported to NAFO.

U.S.S.R.<br>(S.A. Studenetsky)

In 1988, as previously, a trawl-acoustic survey was carried out to assess abundance and biomass of the main commercial fish species, a potential recruitment to cod, haddock, redfish and other fish stocks was evaluated during ichthyoplankton and joung fish surveys in the Barents Sea and adjacent waters.

Investigations were continued to determine relationships between distribution of fish, their behaviour and hydrological conditions, food supply. Stock structure of major commercial fishes, dynamics of their biological characteristics and migration patterns were studied. The investigation of trophic interrelations of stocks was in progress.

Tables 1-8 present information collected during 1988.
